

Dose Building Using Example Vanderbilt EHR Data

Introduction

We have provided the medExtractR output and gold standards for the tacrolimus and lamotrigine test sets used to develop the dose building algorithm detailed in this paper. This data comes from Vanderbilt's EHR system. In this vignette, we show how to access this data, how to implement the algorithm, and how to compare the algorithm output to the gold standard using the tacrolimus data. More details of the functions used in the algorithm can be found in our EHR vignette for Extract-Med and Pro-Med-NLP.

medExtractR Output

Several rows of the medExtractR output for tacrolimus are shown below.

```
tac_mxr_fn <- system.file("examples", "tac_mxr_out.csv", package = "EHR")
tac_mxr <- read.csv(tac_mxr_fn, na = '')
tac_mxr[c(135:139,163:167,283:289,343:346),]
```

Part I

The first step of Part I of our algorithm is parsing the raw NLP output. This results in a standardized form of the data that includes a row for each drug mention and columns for all entities anchored to that drug mention. Here, we use the `parseMedExtractR` function since we are using medExtractR output as an example.

```
tac_mxr_parsed <- parseMedExtractR(tac_mxr_fn)
```

Below are the rows of the parsed output corresponding to the raw NLP output from above.

```
##                filename                drugname                strength
## 1 X240866534_2010-01-28_4070129 Tacrolimus::839::849
## 2 X240866534_2010-01-28_4070129   Prograf::851::858 1 mg::860::864
## 3 X240866534_2010-01-28_9659069 Tacrolimus::150::160
## 4 X240866534_2010-01-28_9659069   Prograf::162::169 1 mg::171::175
## 5 X410930205_2006-06-20_3473651   Prograf::870::877
## 6 X410930205_2006-06-20_3473651   prograf::943::950 1mg::951::954
## 7 X410930205_2006-06-20_2809083   prograf::560::567 1mg::568::571
##
##                dose route                freq                dosestr
## 1
## 2 4::874::875          every twelve hours::888::906
## 3
## 4 4::185::186          every twelve hours::199::217
## 5                                BID::882::885 3mg::878::881
## 6 3::955::956                                bid::961::964
## 7 3::572::573                                bid::578::581
##
##                dosechange lastdose
## 1
## 2
## 3
## 4
## 5
## 6
## 7
```

Next, the parsed entities are paired using the `buildDose` function. This results in a dataset with a column for each entity and a row for each pairing.

```
tac_mxr_part1_out <- buildDose(tac_mxr_parsed)
```

The output is shown below.

```
##                filename                drugname                strength                dose                route

## 105 X410930205_2006-06-20_3473651   prograf      943    1mg   3   NA
## 107 X410930205_2006-06-20_2809083   prograf      560    1mg   3   NA
##          freq dosestr dosechange
## 51          <NA>   <NA>   <NA>
## 52 every twelve hours <NA>   <NA>
## 53          <NA>   <NA>   <NA>
## 54 every twelve hours <NA>   <NA>
## 104          BID     3mg   <NA>
## 105          bid   <NA>   <NA>
## 107          bid   <NA>   <NA>
```

The following code compares the gold standard to the Part I output and provides the recall and precision measures.

```
precall <- function(dat, gs) {
  tp1 <- sum(dat %in% gs)
  fp1 <- sum(!(dat %in% gs))
  fn1 <- sum(!(gs %in% dat))
  r1 <- c(tp1, tp1 + fn1)
  p1 <- c(tp1, tp1 + fp1)
  r <- rbind(r1,p1)
  dimnames(r) <- list(c('recall','prec'), c('num','den'))
  cbind(r, prop = round(r[,1] / r[,2], 2))
}

colsToCompare <- c('filename','drugname','strength','dose','route','freq',
  'dosestr','dosechange','drugname_start')
tac_mxr_part1_out <- tac_mxr_part1_out[,colsToCompare]
tac_gs_part1 <- tac_gs_part1[,colsToCompare]

tacxrrow <- do.call(paste, c(tac_mxr_part1_out, sep = '|'))
gs.tacxrrow <- do.call(paste, c(tac_gs_part1, sep = '|'))

precall(tacxrrow, gs.tacxrrow)

##          num den prop
## recall 285 285    1
## prec   285 285    1
```

Part II

In part II of the algorithm, the final datasets are formed containing dose intake and daily dose, and redundancies are removed at the note and date level for each patient.

This part of the algorithm requires more detailed meta data associated with each clinical note file. This is shown below using our example tacrolimus data.

```
bmd <- function(x) {
  fns <- strsplit(x, '_')
  pid <- sapply(fns, `[`, 1)
  date <- as.Date(sapply(fns, `[`, 2), format = '%Y-%m-%d')
  note <- sapply(fns, `[`, 3)
  data.frame(filename = x, pid, date, note, stringsAsFactors = FALSE)
}
tac_metadata <- bmd(tac_mxr_part1_out[['filename']])
```

```
##                filename          pid      date    note
## 51 X240866534_2010-01-28_4070129 X240866534 2010-01-28 4070129
## 55 X240866534_2010-01-28_9659069 X240866534 2010-01-28 9659069
## 104 X410930205_2006-06-20_2809083 X410930205 2006-06-20 2809083
## 105 X410930205_2006-06-20_3473651 X410930205 2006-06-20 3473651
```

Below, a few rows of the note level and date level collapsing are shown for our example tacrolimus data.

```
tac_part2 <- collapseDose(tac_mxr_part1_out, tac_metadata, naFreq='most')
```

Note level:

```
