Package 'IRkernel'

January 3, 2022

Title Native R Kernel for the 'Jupyter Notebook'

Description The R kernel for the 'Jupyter' environment executes R code which the front-end ('Jupyter Notebook' or other front-ends) submits to the kernel via the network.

Version 1.3

URL https://irkernel.github.io

BugReports https://github.com/IRkernel/IRkernel/issues/

Depends R (>= 3.2.0)

Suggests testthat, roxygen2

SystemRequirements jupyter, jupyter_kernel_test (Python package for testing)

License MIT + file LICENSE

Encoding UTF-8

Imports repr (>= 0.4.99), methods, evaluate (>= 0.10), IRdisplay (>= 0.3.0.9999), pbdZMQ (>= 0.2-1), crayon, jsonlite (>= 0.9.6), uuid, digest

Collate 'class_unions.r' 'logging.r' 'comm_manager.r' 'compat.r' 'completion.r' 'environment_runtime.r' 'environment_shadow.r' 'options.r' 'execution.r' 'handlers.r' 'help.r' 'installspec.r' 'utils.r' 'kernel.r' 'main.r' 'onload.r'

RoxygenNote 7.1.2

NeedsCompilation no

R topics documented:

`Comm-class` *The Comm*

Description

Has methods able to register and handle message callbacks

`CommManager-class` *The CommManager*

Description

Has methods able to register comms/targets and process comm messages

---

`comm_manager` *Get global CommManager instance*

Description

Get global CommManager instance

Usage

```
comm_manager()
```

Value

CommManager instance if a kernel is running, else NULL

`installspec` *Install the kernelspec to tell Jupyter about IRkernel.*

Description

This can be called multiple times for different R interpreter, but you have to give a different name (and displayname to see a difference in the notebook UI). If the same name is give, it will overwrite older versions of the kernel spec with that name!

Usage

```
installspec(
  user = NULL,
  name = "ir",
  displayname = "R",
  rprofile = NULL,
  prefix = NULL,
  sys_prefix = NULL,
  verbose = getOption("verbose")
)
```

Arguments

`user`	Install into user directory (`$XDG_DATA_HOME/jupyter/kernels`) or globally? (default: NULL but treated as TRUE if "prefix" is not specified)
`name`	The name of the kernel (default "ir")
`displayname`	The name which is displayed in the notebook (default: "R")
`rprofile`	(optional) Path to kernel-specific Rprofile (defaults to system-level settings)
`prefix`	(optional) Path to alternate directory to install kernelspec into (default: NULL)
`sys_prefix`	(optional) Install kernelspec using the `--sys-prefix` option of the currently detected jupyter (default: NULL)
`verbose`	(optional) If `FALSE`, silence output of `install`

Value

Exit code of the `jupyter kernelspec install` call.

`jupyter_option_defaults` *An R kernel for Jupyter.*

Description

Jupyter speaks a JSON+ZMQ protocol to a 'kernel' which is responsible for executing code. This package is a kernel for the R language.

Usage

```
jupyter_option_defaults
```

Format

An object of class `list` of length 7.

Options

The following can be set/read via `options(opt.name = ...)` / `getOption('opt.name')`

`jupyter.log_level` 1L (errors), 2L (warnings), or 3L (debug). 1L is the default.

`jupyter.pager_classes` Classes to use the pager for instead of displaying them inline. Default: help pages

`jupyter.in_kernel` `TRUE` if this code is executed in a running kernel. Set to pretend being/not being in a kernel

`jupyter.rich_display` Use more than just text display

`jupyter.display_mimetypes` The formats emitted when any return value is to be displayed (default: all mimetypes listed here)

`jupyter.plot_mimetypes` The plot formats emitted to the frontend when a plot is displayed. (default: image/png and application/pdf)

`jupyter.plot_scale` The ratio (notebook PPI / `repr.plot.res`). E.g.: With the defaults `repr.plot.res`=120 px/in (PPI) and `jupyter.plot_scale`=2, a 1in×1in image will be displayed as a 0.5in×0.5in, 240 PPI image. (default: 2, fit for retina displays)

See Also

installspec

log *Kernel logging functions*

Description

A set of exported logging utilities that have the capability to be used in upstream projects. Log level and log file can be set via R package options e.g. `options(jupyter.log_level = 2L)` or from the environment variables JUPYTER_LOG_LEVEL and JUPYTER_LOGFILE.

Usage

```
log_debug(...)

log_info(...)

log_error(...)
```

Arguments

`...`	message to log

main *Initialise and run the kernel*

Description

Initialise and run the kernel

Usage

```
main(connection_file = "")
```

Arguments

`connection_file`	The path to the Jupyter connection file, written by the frontend
