

Package ‘Rpolyhedra’

June 26, 2022

Type Package

Title Polyhedra Database

Version 0.5.3

Language en-US

Maintainer Alejandro Baranek <abaranek@dc.uba.ar>

Description

A polyhedra database scraped from various sources as R6 objects and 'rgl' visualizing capabilities.

License MIT + file LICENSE

Encoding UTF-8

RoxygenNote 7.2.0

VignetteBuilder knitr

Depends R (>= 3.5.0)

Imports R6, geometry, rgl, stringr, XML, digest, lgr, git2r

Suggests testthat, dplyr, knitr, pkgdown, rmarkdown, covr, codemeter

Collate 'Rpolyhedra-package.R' 'polyhedra-lib.R' 'ledger-lib.R'
'db-lib.R' 'env-lib.R' 'package-lib.R' 'serialization-lib.R'
'public-lib.R' 'test-lib.R' 'zzz.R'

Rpolyhedra-package *Rpolyhedra: Polyhedra Database*

Description

A polyhedra database scraped from various sources as R6 objects and 'rgl' visualizing capabilities.

Details

A polyhedra database scraped from:

- <http://paulbourke.net/dataformats/phd/>: PHD files as R6 objects and 'rgl' visualizing capabilities. The PHD format was created to describe the geometric polyhedra definitions derived mathematically <<http://www.netlib.org/polyhedra/>> by Andrew Hume and by the Kaleido program of Zvi Har'El.
- <http://dmccoey.com/Polyhedra/>: Polyhedra text datafiles.

Author(s)

genLogger

genLogger

Description

Returns a configured logger with threshold according r6 object. This function is usually called in class constructors

Usage

```
genLogger(r6.object)
```

Arguments

r6.object an r6.object

Author(s)

ken4rab

getAvailablePolyhedra *Get available polyhedra*

Description

Gets the list of names of available polyhedra and its status in the polyhedra database, which can be later called with getPolyhedron

Usage

```
getAvailablePolyhedra(sources, search.string)
```

Arguments

`sources` A string vector containing the source, which can be obtained from `getAvailableSources()`.

`search.string` A search string

Value

polyhedra names vector

See Also

`getAvailableSources`

Examples

```
# gets all polyhedra in the database
available.polyhedra <- getAvailablePolyhedra()

# returns all polyhedra from a given source, in this case, netlib
available.netlib.polyhedra <- getAvailablePolyhedra(sources = "netlib")

# search within the polyhedron names

cube <- getAvailablePolyhedra(sources = "netlib", search.string = "cube")
cube
```

`getAvailableSources` *Get available sources*

Description

Gets the list of names of available sources in database to be used later as references to the package.

Usage

```
getAvailableSources()
```

Value

`sources` string vector, which can be obtained from `getAvailableSources()`

See Also

`getAvailablePolyhedra`, `getPolyhedron`

Examples

```
# gets all sources in the database
available.sources <- getAvailableSources()

# returns all polyhedra from all sources
available.polyhedra <- getAvailablePolyhedra(sources = available.sources)

# search within the polyhedron names from all sources
cubes <- getAvailablePolyhedra(
  sources = available.sources,
  search.string = "cube"
)
cubes
```

getLogger

getLogger

Description

Returns the configured lgr of an r6 object. If the object don't have a lgr or is not initialized returns an error

Usage

```
getLogger(r6.object)
```

Arguments

r6.object an r6.object

Author(s)

ken4rab

getPolyhedraObject

Get a polyhedra object

Description

Return the polyhedra database handler.

Usage

```
getPolyhedraObject()
```

Value

.polyhedra

See Also

PolyhedraDatabase

getPolyhedron

Get polyhedron

Description

Gets a polyhedron from the database. It returns an R6 Class with all its characteristics and functions. The object returned, of type Polyhedron, allows to the user to get access to all the functionality provided.

Usage

```
getPolyhedron(source = "netlib", polyhedron.name)
```

Arguments

source string vector, which can be obtained from `getAvailableSources()`
polyhedron.name a valid name of a polyhedron in the database. Current names can be found with `getAvailablePolyhedra()`

Value

polyhedron R6 object

See Also

`getAvailablePolyhedra`, `getAvailableSources`

Examples

```
tetrahedron <- getPolyhedron(  
  source = "netlib",  
  polyhedron.name = "tetrahedron"  
)  
  
# returns name of polyhedra  
tetrahedron$getName()  
  
# polyhedron state  
tetrahedron.state <- tetrahedron$getState()
```

```
# Johnson symbol and Schlafli symbol
tetrahedron.state$getSymbol()

# vertex data.frame
tetrahedron.state$getVertices()

# List of faces of solid representation (3D)
tetrahedron.state$getSolid()

# List of faces of net representation (2D)
tetrahedron.state$getNet()
```

loggerSetupFile	<i>loggerSetupFile</i>
-----------------	------------------------

Description

loggerSetupFile

Usage

```
loggerSetupFile(log.file, default.threshold = "info")
```

Arguments

log.file	log path for logging file
default.threshold	threshold for setting root. Default = "info"

Author(s)

kenarab

PolyhedraDatabase	<i>Polyhedra database</i>
-------------------	---------------------------

Description

Scrapes all polyhedra in data folder to save a representation which is accessible by the final users upon call to getPolyhedron().

Public fields

version version of database file
 polyhedra.rds.file path of rds database file
 sources.config Sources configuration for scraping different sources
 ledger rr ledger of scraping process
 logger class logger

Methods**Public methods:**

- PolyhedraDatabase\$new()
- PolyhedraDatabase\$getVersion()
- PolyhedraDatabase\$configPolyhedraRDSPath()
- PolyhedraDatabase\$existsSource()
- PolyhedraDatabase\$addSourceConfig()
- PolyhedraDatabase\$existsPolyhedron()
- PolyhedraDatabase\$getPolyhedraSourceDir()
- PolyhedraDatabase\$getPolyhedronFilename()
- PolyhedraDatabase\$getPolyhedron()
- PolyhedraDatabase\$addPolyhedron()
- PolyhedraDatabase\$configPolyhedraSource()
- PolyhedraDatabase\$saveRDS()
- PolyhedraDatabase\$cover()
- PolyhedraDatabase\$scrape()
- PolyhedraDatabase\$testRR()
- PolyhedraDatabase\$generateTestTasks()
- PolyhedraDatabase\$schedulePolyhedraSources()
- PolyhedraDatabase\$getAvailableSources()
- PolyhedraDatabase\$getAvailablePolyhedra()
- PolyhedraDatabase\$clone()

Method new(): Create a new PolyhedraDatabase object.

Usage:

PolyhedraDatabase\$new()

Returns: A new 'PolyhedraDatabase' object.

Method getVersion(): get the version of the current object.

Usage:

PolyhedraDatabase\$getVersion()

Returns: Database version

Method configPolyhedraRDSPath(): sets the path of the RDS object

Usage:

PolyhedraDatabase\$configPolyhedraRDSPath()

Returns: Database version

Method existsSource(): Determines if the source exists on the database

Usage:

PolyhedraDatabase\$existsSource(source)

Arguments:

source source description

Returns: boolean value

Method addSourceConfig(): add source.config to the database

Usage:

PolyhedraDatabase\$addSourceConfig(source.config)

Arguments:

source.config SourceConfig object able to scrape source polyhedra definitions

Returns: PolyhedraDatabase object

Method existsPolyhedron(): Determines if the database includes a polyhedron which name matches the parameter value

Usage:

PolyhedraDatabase\$existsPolyhedron(source = "netlib", polyhedron.name)

Arguments:

source source description

polyhedron.name polyhedron description

Returns: boolean value

Method getPolyhedraSourceDir(): gets polyhedra sources folder

Usage:

PolyhedraDatabase\$getPolyhedraSourceDir(source, create.dir = TRUE)

Arguments:

source source description

create.dir if dir does not exists, create it

Returns: string with polyhedra sources path

Method getPolyhedronFilename(): gets the filename of the polyhedron matching parameter.

Usage:

PolyhedraDatabase\$getPolyhedronFilename(source, polyhedron.name, extension)

Arguments:

source source description

polyhedron.name polyhedron description

extension extension of the polyhedron filename

Returns: string with polyhedron filename

Method `getPolyhedron()`: gets polyhedron object which name matches the parameter value

Usage:

```
PolyhedraDatabase$getPolyhedron(
  source = "netlib",
  polyhedron.name,
  strict = FALSE
)
```

Arguments:

source source description
 polyhedron.name polyhedron description
 strict halts execution if polyhedron not found

Returns: Polyhedron object

Method `addPolyhedron()`: add polyhedron object to the database

Usage:

```
PolyhedraDatabase$addPolyhedron(
  source = "netlib",
  source.filename,
  polyhedron,
  overwrite = FALSE,
  save.on.change = FALSE
)
```

Arguments:

source source description
 source.filename filename of the polyhedron source definition
 polyhedron polyhedron object
 overwrite overwrite exiting definition
 save.on.change saves Database state after operation

Returns: Polyhedron object

Method `configPolyhedraSource()`: Process parameter filenames using source.config parameter

Usage:

```
PolyhedraDatabase$configPolyhedraSource(
  source.config,
  source.filenames = NULL,
  max.quant = 0,
  save.on.change = FALSE
)
```

Arguments:

source.config source configuration for scraping files
 source.filenames filenames of the polyhedron source definition

max.quant maximum filenames to process
 save.on.change saves Database state after operation

Returns: Modified 'PolyhedraDatabase' object.

Method saveRDS(): saveRDS

Usage:

```
PolyhedraDatabase$saveRDS(save.on.change = TRUE)
```

Arguments:

save.on.change saves Database state after operation

Returns: saveRDS return status

Method cover(): Cover objects and applies covering.code parameter

Usage:

```
PolyhedraDatabase$cover(  
  mode,  
  sources = names(self$sources.config),  
  covering.code,  
  polyhedra.names = NULL,  
  max.quant = 0,  
  save.on.change = FALSE,  
  seed = NULL  
)
```

Arguments:

mode covering mode. Available values are "scrape.queued", "scrape.retry", "skipped", "test"

sources sources names

covering.code code for applying in covering

polyhedra.names polyhedra names to cover (optional)

max.quant maximum numbers of polyhedra to cover

save.on.change saves Database state after operation

seed seed for deterministic random generator

Returns: A list with resulting objects covered

Method scrape(): Scrape polyhedra queued sources

Usage:

```
PolyhedraDatabase$scrape(  
  mode = "scrape.queued",  
  sources = names(self$sources.config),  
  max.quant = 0,  
  time2scrape.source = 30,  
  save.on.change = FALSE,  
  skip.still.queued = FALSE  
)
```

Arguments:

mode covering mode. Available values are "scrape.queued", "scrape.retry", "skipped", "test"

`sources` sources names
`max.quant` maximum numbers of polyhedra to cover
`time2scrape.source` maximum time to spend scraping each source
`save.on.change` saves Database state after operation
`skip.still.queued` Flag unscraped files with status 'skipped'
`covering.code` code for applying in covering
`polyhedra.names` polyhedra names to cover (optional)

Returns: A list with resulting objects covered

Method `testRR(): testRR`

Usage:

```
PolyhedraDatabase$testRR(sources = names(self$sources.config), max.quant = 0)
```

Arguments:

`sources` sources names
`max.quant` maximum numbers of polyhedra to cover

Returns: A list with resulting objects tested

Method `generateTestTasks(): generate Test tasks for selected polyhedra`

Usage:

```
PolyhedraDatabase$generateTestTasks(
  sources = names(self$sources.config),
  polyhedra.names = NULL,
  TestTaskClass,
  max.quant = 0
)
```

Arguments:

`sources` sources names
`polyhedra.names` polyhedra names to cover (optional)
`TestTaskClass` an R6 TestTaskClass class
`max.quant` maximum numbers of polyhedra to cover

Returns: A list with resulting TestTasks generated

Method `schedulePolyhedraSources(): Schedules polyhedra sources for scraping`

Usage:

```
PolyhedraDatabase$schedulePolyhedraSources(
  sources.config = getPackageEnvir(".available.sources"),
  source.fileNames = NULL,
  max.quant = 0,
  save.on.change = FALSE
)
```

Arguments:

`sources.config` sources configurations for scraping files
`source.fileNames` fileNames of the polyhedron source definition

max.quant maximum filenames to process
 save.on.change saves Database state after operation

Returns: Modified 'PolyhedraDatabase' object.

Method getAvailableSources(): Returns available sources in current database

Usage:

```
PolyhedraDatabase$getAvailableSources()
```

Returns: A vector with names of available sources

Method getAvailablePolyhedra(): Retrieves all polyhedron within the source those names match with search.string

Usage:

```
PolyhedraDatabase$getAvailablePolyhedra(  
  sources = self$getAvailableSources(),  
  search.string = NULL,  
  ignore.case = TRUE  
)
```

Arguments:

sources sources names
 search.string string for matching polyhedron names
 ignore.case ignore case in search string

Returns: A list with resulting objects covered

Method clone(): The objects of this class are cloneable with this method.

Usage:

```
PolyhedraDatabase$clone(deep = FALSE)
```

Arguments:

deep Whether to make a deep clone.

Polyhedron

Polyhedron

Description

Polyhedron container class, which is accessible by the final users upon call

Public fields

file.id Polyhedron file.id
 state Polyhedron state
 logger class logger

Methods**Public methods:**

- [Polyhedron\\$new\(\)](#)
- [Polyhedron\\$scrapeNetlib\(\)](#)
- [Polyhedron\\$scrapeDmccooy\(\)](#)
- [Polyhedron\\$deserialize\(\)](#)
- [Polyhedron\\$getName\(\)](#)
- [Polyhedron\\$getState\(\)](#)
- [Polyhedron\\$getSolid\(\)](#)
- [Polyhedron\\$isChecked\(\)](#)
- [Polyhedron\\$getRGLModel\(\)](#)
- [Polyhedron\\$exportToXML\(\)](#)
- [Polyhedron\\$getErrors\(\)](#)
- [Polyhedron\\$checkProperties\(\)](#)
- [Polyhedron\\$clone\(\)](#)

Method `new()`: Create a polyhedronState object

Usage:

```
Polyhedron$new(file.id, state = NULL)
```

Arguments:

`file.id` the file id

`state` polyhedron state object

Returns: A new Polyhedron object.

Method `scrapeNetlib()`: scrape Netlib polyhedron definition

Usage:

```
Polyhedron$scrapeNetlib(netlib.p3.lines)
```

Arguments:

`netlib.p3.lines` vector with netlib definition lines

Returns: A new PolyhedronStateDefined object.

Method `scrapeDmccooy()`: scrape Dmccooy polyhedron definition

Usage:

```
Polyhedron$scrapeDmccooy(polyhedra.dmccooy.lines)
```

Arguments:

`polyhedra.dmccooy.lines` vector with Dmccooy definition lines

Returns: A new PolyhedronStateDefined object.

Method `deserialize()`: deserialize a polyhedron state definition

Usage:

```
Polyhedron$deserialize(serialized.polyhedron)
```

Arguments:

serialized.polyhedron a serialized version of a polyhedron state

Returns: A new PolyhedronStateDefined object.

Method getName(): get Polyhedron name

Usage:

Polyhedron\$getName()

Returns: string with polyhedron name

Method getState(): Gets polyhedron state

Usage:

Polyhedron\$getState()

Returns: A new PolyhedronState object.

Method getSolid(): Gets a solid definition

Usage:

Polyhedron\$getSolid()

Returns: A list of vertex vectors composing polyhedron faces.

Method isChecked(): checks Edges consistency

Usage:

Polyhedron\$isChecked()

Returns: A boolean value

Method getRGLModel(): Return an 'rgl' model with an optional transformation described by transformation.matrix parameter

Usage:

Polyhedron\$getRGLModel(transformation.matrix = NULL)

Arguments:

transformation.matrix transformation matrix parameter

Returns: An tmesh3d object

Method exportToXML(): exports an XML definition of current polyhedron

Usage:

Polyhedron\$exportToXML()

Returns: A character object with the XML definition

Method getErrors(): returns the errors found when processing current polyhedron

Usage:

Polyhedron\$getErrors()

Returns: a data.frame with polyhedron errors

Method checkProperties(): check properties of current polyhedron

Usage:

Polyhedron\$checkProperties(expected.vertices, expected.faces)

Arguments:

expected.vertices expected vertices number

expected.faces expected faces number

Returns: Unmodified polyhedron object

Method clone(): The objects of this class are cloneable with this method.

Usage:

Polyhedron\$clone(deep = FALSE)

Arguments:

deep Whether to make a deep clone.

Author(s)

ken4rab

PolyhedronState

PolyhedronState

Description

This abstract class provide the basis from which every polyhedron state class derivate.

Public fields

source polyhedron definition source

file.id polyhedron file id

errors Errors string

logger class logger

Methods**Public methods:**

- [PolyhedronState\\$new\(\)](#)
- [PolyhedronState\\$addError\(\)](#)
- [PolyhedronState\\$scrape\(\)](#)
- [PolyhedronState\\$name\(\)](#)
- [PolyhedronState\\$getSolid\(\)](#)
- [PolyhedronState\\$checkEdgesConsistency\(\)](#)
- [PolyhedronState\\$applyTransformationMatrix\(\)](#)
- [PolyhedronState\\$buildRGL\(\)](#)
- [PolyhedronState\\$exportToXML\(\)](#)

- [PolyhedronState\\$clone\(\)](#)

Method new(): Create a polyhedronState object

Usage:

```
PolyhedronState$new(source, file.id)
```

Arguments:

source the source file

file.id the file id

Returns: A new PolyhedronState object. '@description Adds an error to the error string and log it as info

Method addError():

Usage:

```
PolyhedronState$addError(current.error)
```

Arguments:

current.error the error to add

Method scrape(): Scrapes the polyhedra folder files

Usage:

```
PolyhedronState$scrape()
```

Method getName(): Get Polyhedron name

Usage:

```
PolyhedronState$getName()
```

Returns: string with polyhedron name

Method getSolid(): Returns the object corresponding to the solid

Usage:

```
PolyhedronState$getSolid()
```

Method checkEdgesConsistency(): Checks edge consistency

Usage:

```
PolyhedronState$checkEdgesConsistency()
```

Method applyTransformationMatrix(): Apply transformation matrix to polyhedron

Usage:

```
PolyhedronState$applyTransformationMatrix(transformation.matrix)
```

Arguments:

transformation.matrix the transformation matrix to apply to the polyhedron

Method buildRGL(): Creates a 'rgl' representation of the object

Usage:

```
PolyhedronState$buildRGL(transformation.matrix)
```

Arguments:

transformation.matrix the transformation matrix to apply to the polyhedron

Method exportToXML(): Gets an XML representation out of the polyhedron object

Usage:

PolyhedronState\$exportToXML()

Method clone(): The objects of this class are cloneable with this method.

Usage:

PolyhedronState\$clone(deep = FALSE)

Arguments:

deep Whether to make a deep clone.

Author(s)

ken4rab

PolyhedronStateDefined

PolyhedronStateDefined

Description

Polyhedron State scraped and defined

Super class

[Rpolyhedra::PolyhedronState](#) -> PolyhedronStateDefined

Public fields

file.id polyhedron filename in original

source polyhedron definition source (netlibdmccoey)

name polyhedron name (netlibdmccoey)

symbol the eqn(1) input for two symbols separated by a tab; the Johnson symbol, and the Schläfli symbol (netlib)

dual the name of the dual polyhedron optionally followed by a horizontal tab and the number of the dual (netlib)

sfaces polyhedron solid face list (netlib)

svertices polyhedron solid vertices list (netlib)

vertices Polyhedron vertices list (netlibdmccoey)

vertices.centered centered vertices for applying transformation matrices

net polyhedron 2D net model with vertices defined for a planar representation (netlib)

solid polyhedron list of edges which generate a solid (netlibdmccoey)
 hinges Polyhedron hinge list (netlib)
 dih Dih attribute (netlib)
 edges polyhedron edges (netlibdmccoey)
 transformation.matrix transformation matrix for calculations and visualizing polyhedron

Methods

Public methods:

- [PolyhedronStateDefined\\$new\(\)](#)
- [PolyhedronStateDefined\\$scrape\(\)](#)
- [PolyhedronStateDefined\\$name\(\)](#)
- [PolyhedronStateDefined\\$symbol\(\)](#)
- [PolyhedronStateDefined\\$adjustVertices\(\)](#)
- [PolyhedronStateDefined\\$vertices\(\)](#)
- [PolyhedronStateDefined\\$net\(\)](#)
- [PolyhedronStateDefined\\$solid\(\)](#)
- [PolyhedronStateDefined\\$inferEdges\(\)](#)
- [PolyhedronStateDefined\\$checkEdgesConsistency\(\)](#)
- [PolyhedronStateDefined\\$triangulate\(\)](#)
- [PolyhedronStateDefined\\$convHull\(\)](#)
- [PolyhedronStateDefined\\$calculateMassCenter\(\)](#)
- [PolyhedronStateDefined\\$normalizedSize\(\)](#)
- [PolyhedronStateDefined\\$transformedVertices\(\)](#)
- [PolyhedronStateDefined\\$resetTransformationMatrix\(\)](#)
- [PolyhedronStateDefined\\$applyTransformationMatrix\(\)](#)
- [PolyhedronStateDefined\\$buildRGL\(\)](#)
- [PolyhedronStateDefined\\$exportToXML\(\)](#)
- [PolyhedronStateDefined\\$expectEqual\(\)](#)
- [PolyhedronStateDefined\\$serialize\(\)](#)
- [PolyhedronStateDefined\\$clone\(\)](#)

Method `new()`: object initialization routine

Usage:

```

PolyhedronStateDefined$new(
  source,
  file.id,
  name,
  vertices,
  solid,
  net = NULL,
  symbol = "",
  dual = NULL,
  sfaces = NULL,

```

```

    svertices = NULL,
    hinges = NULL,
    dih = NULL,
    normalize.size = TRUE
)

```

Arguments:

source the library to use
 file.id identifier of the definition file.
 name the polyhedron name
 vertices the vertices
 solid the solid object
 net the net
 symbol the symbol
 dual whether it is dual or not
 sfaces the solid faces
 svertices the solid vertices
 hinges the hinges
 dih the dih
 normalize.size whether it has to normalize the size or not

Returns: A new PolyhedronStateDefined object.

Method scrape(): scrape polyhedron. As the state is defined this functions do nothing

Usage:

```
PolyhedronStateDefined$scrape()
```

Returns: current object

Method getName(): get Polyhedron name

Usage:

```
PolyhedronStateDefined$getName()
```

Returns: string with polyhedron name

Method getSymbol(): get Polyhedron symbol

Usage:

```
PolyhedronStateDefined$getSymbol()
```

Returns: string with polyhedron symbol

Method adjustVertices(): adjust polyhedron Vertices

Usage:

```
PolyhedronStateDefined$adjustVertices(normalize.size = TRUE)
```

Arguments:

normalize.size whether it has to normalize the size or not

Returns: modified PolyhedronStateDefined object.

Method `getVertices()`: Get the polyhedron state

Usage:

```
PolyhedronStateDefined$getVertices(solid = FALSE)
```

Arguments:

`solid` toggles the production of solid vertices.

Method `getNet()`: Gets the net property

Usage:

```
PolyhedronStateDefined$getNet()
```

Method `getSolid()`: Gets the solid property

Usage:

```
PolyhedronStateDefined$getSolid()
```

Method `inferEdges()`: Infer edges

Usage:

```
PolyhedronStateDefined$inferEdges(force.recalculation = FALSE)
```

Arguments:

`force.recalculation` forces the recalculation of the edges

Method `checkEdgesConsistency()`: Checks edges consistency

Usage:

```
PolyhedronStateDefined$checkEdgesConsistency()
```

Method `triangulate()`: Triangulates the polyhedron

Usage:

```
PolyhedronStateDefined$triangulate(force = FALSE)
```

Arguments:

`force` forces the triangulation.

Method `getConvHull()`: Gets the convex hull

Usage:

```
PolyhedronStateDefined$getConvHull(  
  transformation.matrix = self$transformation.matrix,  
  vertices.id.3d = private$vertices.id.3d  
)
```

Arguments:

`transformation.matrix` the transformation matrix

`vertices.id.3d` the vertices ids

Returns: the convex hull

Method `calculateMassCenter()`: Calculates the center of mass.

Usage:

```
PolyhedronStateDefined$calculateMassCenter(
  vertices.id.3d = private$vertices.id.3d,
  applyTransformation = TRUE
)
```

Arguments:

vertices.id.3d the vertices ids

applyTransformation does it need to apply transformations?

Method getNormalizedSize(): Gets the normalized size

Usage:

```
PolyhedronStateDefined$getNormalizedSize(size)
```

Arguments:

size the object's size

Method getTransformedVertices(): Gets the transformed vertices

Usage:

```
PolyhedronStateDefined$getTransformedVertices(
  vertices = self$vertices.centered,
  transformation.matrix = self$transformation.matrix
)
```

Arguments:

vertices input vertices

transformation.matrix the transformation matrix

Method resetTransformationMatrix(): Resets the transformation matrix

Usage:

```
PolyhedronStateDefined$resetTransformationMatrix()
```

Method applyTransformationMatrix(): Apply transformation matrix to polyhedron

Usage:

```
PolyhedronStateDefined$applyTransformationMatrix(transformation.matrix)
```

Arguments:

transformation.matrix the transformation matrix to apply to the polyhedron

Returns: an applied transformation.matrix

Method buildRGL(): Build 'rgl'

Usage:

```
PolyhedronStateDefined$buildRGL(transformation.matrix = NULL)
```

Arguments:

transformation.matrix the transformation matrix

Method exportToXML(): Exports the object to XML format

Usage:

PolyhedronStateDefined\$exportToXML()

Method expectEqual(): Determines if a polyhedron is equal to this one.

Usage:

PolyhedronStateDefined\$expectEqual(polyhedron)

Arguments:

polyhedron the polyhedron to compare to.

Method serialize(): Serialize the object.

Usage:

PolyhedronStateDefined\$serialize()

Method clone(): The objects of this class are cloneable with this method.

Usage:

PolyhedronStateDefined\$clone(deep = FALSE)

Arguments:

deep Whether to make a deep clone.

Author(s)

PolyhedronStateDeserializer

PolyhedronStateDeserializer

Description

Polyhedron state for deserialize from database

Super class

[Rpolyhedra::PolyhedronState](#) -> PolyhedronStateDeserializer

Public fields

serialized.polyhedron polyhedron definition serialized

Methods

Public methods:

- [PolyhedronStateDeserializer\\$new\(\)](#)
- [PolyhedronStateDeserializer\\$scrape\(\)](#)
- [PolyhedronStateDeserializer\\$clone\(\)](#)

Method `new()`: Initialize PolyhedronStateDeserializer object

Usage:

```
PolyhedronStateDeserializer$new(serialized.polyhedron)
```

Arguments:

`serialized.polyhedron` a serialized polyhedron

Returns: A new PolyhedronStateDeserializer object.

Method `scrape()`: Generates a PolyhedronStateDefined from a serialized polyhedron

Usage:

```
PolyhedronStateDeserializer$scrape()
```

Returns: A new PolyhedronStateDefined object.

Method `clone()`: The objects of this class are cloneable with this method.

Usage:

```
PolyhedronStateDeserializer$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

PolyhedronStateDmccooleyScraper

PolyhedronStateDmccooleyScraper

Description

Scrapes polyhedra from a dmccooley file format

Super class

[Rpolyhedra::PolyhedronState](#) -> PolyhedronStateDmccooleyScraper

Public fields

regexp.values.names regexp for scraping values names
 regexp.rn regexp for scraping real numbers
 regexp.values regexp for scraping values
 regexp.vertex regexp for scraping vertices
 regexp.faces regexp for scraping faces
 polyhedra.dmccoey.lines dmccoey polyhedra definition lines
 labels.map labels map where values are
 values labels map where values are
 vertices specification
 vertices.replaced 3D values
 faces definition

Methods**Public methods:**

- [PolyhedronStateDmccoeyScraper\\$new\(\)](#)
- [PolyhedronStateDmccoeyScraper\\$setupRegexp\(\)](#)
- [PolyhedronStateDmccoeyScraper\\$scrapeValues\(\)](#)
- [PolyhedronStateDmccoeyScraper\\$scrapeVertices\(\)](#)
- [PolyhedronStateDmccoeyScraper\\$scrapeFaces\(\)](#)
- [PolyhedronStateDmccoeyScraper\\$scrape\(\)](#)
- [PolyhedronStateDmccoeyScraper\\$getName\(\)](#)
- [PolyhedronStateDmccoeyScraper\\$applyTransformationMatrix\(\)](#)
- [PolyhedronStateDmccoeyScraper\\$buildRGL\(\)](#)
- [PolyhedronStateDmccoeyScraper\\$exportToXML\(\)](#)
- [PolyhedronStateDmccoeyScraper\\$clone\(\)](#)

Method `new()`: Initialize Dmccoey scraper

Usage:

```
PolyhedronStateDmccoeyScraper$new(file.id, polyhedra.dmccoey.lines)
```

Arguments:

`file.id` identifier of the definition file.

`polyhedra.dmccoey.lines` raw Dmccoey definition file lines

Returns: A new PolyhedronStateDmccoeyScraper object.

Method `setupRegexp()`: setupRegexp for Dmccoey definition

Usage:

```
PolyhedronStateDmccoeyScraper$setupRegexp()
```

Returns: This PolyhedronStateDmccoeyScraper object with regexp defined.

Method scrapeValues(): scrape values from Dmccooley definition

Usage:

PolyhedronStateDmccooleyScraper\$scrapeValues(values.lines)

Arguments:

values.lines values definitions in Dmccooley source

Returns: This PolyhedronStateDmccooleyScraper object with values defined.

Method scrapeVertices(): scrape polyhedron vertices from definition

Usage:

PolyhedronStateDmccooleyScraper\$scrapeVertices(vertices.lines)

Arguments:

vertices.lines vertices definitions in Dmccooley source

Returns: This PolyhedronStateDmccooleyScraper object with faces defined.

Method scrapeFaces(): scrape polyhedron faces from definition

Usage:

PolyhedronStateDmccooleyScraper\$scrapeFaces(faces.lines)

Arguments:

faces.lines face

Returns: This PolyhedronStateDmccooleyScraper object with faces defined.

Method scrape(): scrape Dmccooley polyhedron definition

Usage:

PolyhedronStateDmccooleyScraper\$scrape()

Returns: A new PolyhedronStateDefined object.

Method getName(): get Polyhedron name

Usage:

PolyhedronStateDmccooleyScraper\$getName()

Returns: string with polyhedron name

Method applyTransformationMatrix(): Apply transformation matrix to polyhedron

Usage:

PolyhedronStateDmccooleyScraper\$applyTransformationMatrix(transformation.matrix)

Arguments:

transformation.matrix the transformation matrix to apply to the polyhedron

Method buildRGL(): Creates a 'rgl' representation of the object

Usage:

PolyhedronStateDmccooleyScraper\$buildRGL(transformation.matrix)

Arguments:

transformation.matrix the transformation matrix to apply to the polyhedron

Method exportToXML(): serializes object in XML

Usage:

PolyhedronStateDmccoeyScraper\$exportToXML()

Method clone(): The objects of this class are cloneable with this method.

Usage:

PolyhedronStateDmccoeyScraper\$clone(deep = FALSE)

Arguments:

deep Whether to make a deep clone.

PolyhedronStateNetlibScraper

PolyhedronStateNetlibScraper

Description

Scrapes polyhedra from a PHD file format.

Super class

[Rpolyhedra::PolyhedronState](#) -> PolyhedronStateNetlibScraper

Public fields

netlib.p3.lines The path to the PHD files

labels.rows Labels - row of appearance

labels.map Labels - Map of content

errors the errors found

Methods

Public methods:

- [PolyhedronStateNetlibScraper\\$new\(\)](#)
- [PolyhedronStateNetlibScraper\\$extractRowsFromLabel\(\)](#)
- [PolyhedronStateNetlibScraper\\$getLabels\(\)](#)
- [PolyhedronStateNetlibScraper\\$scrapeNet\(\)](#)
- [PolyhedronStateNetlibScraper\\$extractCFOutBrackets\(\)](#)
- [PolyhedronStateNetlibScraper\\$scrapeVertices\(\)](#)
- [PolyhedronStateNetlibScraper\\$setupLabelsOrder\(\)](#)
- [PolyhedronStateNetlibScraper\\$getDataFromLabel\(\)](#)

- `PolyhedronStateNetlibScraper$getName()`
- `PolyhedronStateNetlibScraper$scrape()`
- `PolyhedronStateNetlibScraper$applyTransformationMatrix()`
- `PolyhedronStateNetlibScraper$buildRGL()`
- `PolyhedronStateNetlibScraper$exportToXML()`
- `PolyhedronStateNetlibScraper$clone()`

Method `new()`: Initializes the object, taking the file.id and PDH file as parameters

Usage:

```
PolyhedronStateNetlibScraper$new(file.id, netlib.p3.lines)
```

Arguments:

`file.id` the file id

`netlib.p3.lines` the lines to add

Returns: A new PolyhedronStateNetlibScraper object.

Method `extractRowsFromLabel()`: Extracts data from the label, taking the label number and the expected label as parameters

Usage:

```
PolyhedronStateNetlibScraper$extractRowsFromLabel(label.number, expected.label)
```

Arguments:

`label.number` the label number

`expected.label` the expected label

Method `getLabels()`: get Labels from current netlib file description

Usage:

```
PolyhedronStateNetlibScraper$getLabels()
```

Returns: a list containing labels from netlib file description

Method `scrapeNet()`: scrape Net Model from netlib format

Usage:

```
PolyhedronStateNetlibScraper$scrapeNet(net.txt, offset = 0)
```

Arguments:

`net.txt` a vector containing net model in netlib format

`offset` in numbering vertices

Returns: a list containing a net model

Method `extractCFOutBrackets()`: Remove brackets for current field content

Usage:

```
PolyhedronStateNetlibScraper$extractCFOutBrackets(x)
```

Arguments:

`x` a string containing brackets

Returns: value

Method `scrapeVertices()`: scrape vertices described in netlib format

Usage:

```
PolyhedronStateNetlibScraper$scrapeVertices(vertices.txt)
```

Arguments:

`vertices.txt` vector containing netlib format vertices

Returns: data.frame containing netlib vertices

Method `setupLabelsOrder()`: setupLabelsOrder

Usage:

```
PolyhedronStateNetlibScraper$setupLabelsOrder()
```

Arguments:

`vertices.txt` vector containing netlib format vertices

Returns: data.frame containing netlib vertices

Method `getDataFromLabel()`: Get data from label specified as parameter

Usage:

```
PolyhedronStateNetlibScraper$getDataFromLabel(label)
```

Arguments:

`label` the label to get data from

Returns: value

Method `getName()`: get Polyhedron name

Usage:

```
PolyhedronStateNetlibScraper$getName()
```

Returns: string with polyhedron name

Method `scrape()`: scrape Netlib polyhedron definition

Usage:

```
PolyhedronStateNetlibScraper$scrape()
```

Returns: A new PolyhedronStateDefined object.

Method `applyTransformationMatrix()`: Apply transformation matrix to polyhedron

Usage:

```
PolyhedronStateNetlibScraper$applyTransformationMatrix(transformation.matrix)
```

Arguments:

`transformation.matrix` the transformation matrix to apply to the polyhedron

Method `buildRGL()`: Creates a 'rgl' representation of the object

Usage:

```
PolyhedronStateNetlibScraper$buildRGL(transformation.matrix)
```

Arguments:

`transformation.matrix` the transformation matrix to apply to the polyhedron

Method exportToXML(): serializes object in XML

Usage:

```
PolyhedronStateNetlibScraper$exportToXML()
```

Method clone(): The objects of this class are cloneable with this method.

Usage:

```
PolyhedronStateNetlibScraper$clone(deep = FALSE)
```

Arguments:

deep Whether to make a deep clone.

polyhedronToXML

Polyhedron to XML

Description

Gets an XML representation out of the polyhedron object

Usage

```
polyhedronToXML(polyhedron.state.defined, is.transformed.vertices = TRUE)
```

Arguments

polyhedron.state.defined

the polyhedron to get a representation from

is.transformed.vertices

flag which states if vertices are in original position or transformationMatrix applied

Value

an XML document, ready to be converted to String with XML::saveXML()

Examples

```
# get the representation of a cube (netlib library)
XML::saveXML(polyhedronToXML(getPolyhedron("netlib", "cube")$state))
```

scrapePolyhedra	<i>Scrape polyhedra objects</i>
-----------------	---------------------------------

Description

Gets polyhedra objects from text files of different sources, scheduling and scraping using predefined configurations.

Usage

```
scrapePolyhedra(
  scrape.config,
  source.fileNames = NULL,
  sources.config = getUserEnvir(".available.sources"),
  logger = lgr
)
```

Arguments

scrape.config predefined configuration for scraping
 source.fileNames if not null specify which source filenames to scrape
 sources.config the sources that will be used by the function
 logger logger for inheriting threshold from calling class/function

Value

polyhedra db object

scrapePolyhedraSources	<i>Scrape polyhedra sources</i>
------------------------	---------------------------------

Description

Scrapes polyhedra objects from text files of different sources, in order to make them available to the package.

Usage

```
scrapePolyhedraSources(sources.config =
  getUserEnvir(".available.sources"),
  max.quant.config.schedule = 0,
  max.quant.scrape = 0, time2scrape.source = 30,
  source.fileNames = NULL, retry.scrape = FALSE,
  logger = lgr)
```

Arguments

sources.config the sources that will be used by the function
 max.quant.config.schedule
 number of files to schedule
 max.quant.scrape
 number of files scrape
 time2scrape.source
 time applied to scrape source
 source.fileNames
 if not null specify which source filenames to scrape
 retry.scrape should it retry scrape?
 logger logger for inheriting threshold from calling class/function

Value

polyhedra db object

switchToFullDatabase *Switch to full database*

Description

Prompts user for changing database to fulldb in user filespace. Also, allows the user to switch back to the package database, which is a minimal one for testing purposes.

Usage

```
switchToFullDatabase(env = NA, logger = lgr)
```

Arguments

env The environment to run on, can be PACKAGE,
 logger logger for inheriting threshold from calling class/function HOME or NA. If NA, it asks the user for a an Environment.

Value

.data.env
