

# Package ‘amt’

February 23, 2022

**Type** Package

**Title** Animal Movement Tools

**Version** 0.1.7

**Description**

Manage and analyze animal movement data. The functionality of 'amt' includes methods to calculate home ranges, track statistics (e.g. step lengths, speed, or turning angles), prepare data for fitting habitat selection analyses, and simulation of space-use from fitted step-selection functions.

**License** GPL-3

**Encoding** UTF-8

**LazyData** true

**URL** <https://github.com/jmsigner/amt>

**Depends** R (>= 3.5),

**Imports** checkmate, circular, ctm, dplyr (>= 0.7.0), fitdistrplus, lubridate, magrittr, methods, purrr, raster, Rdpack, Rcpp (>= 0.12.7), rgeos, rlang, sf, sp, survival, tibble, tidyr (>= 1.0.0)

**Suggests** adehabitatLT, adehabitatMA, broom, ggplot2, ggraph, geosphere, KernSmooth, FNN, leaflet, moveHMM, move, sessioninfo, spacetime, trajectories, knitr, rmarkdown, tinytest, tidygraph, maptools

**LinkingTo** Rcpp

**RoxygenNote** 7.1.2

**RdMacros** Rdpack

**VignetteBuilder** knitr

**NeedsCompilation** yes

**Author** Johannes Signer [aut, cre],  
Brian Smith [ctb],  
Bjoern Reineking [ctb],  
Ulrike Schlaegel [ctb],  
John Fieberg [ctb],  
Josh O'Brien [ctb],

Bernardo Niebuhr [ctb],  
 Alec Robitaille [ctb],  
 Scott LaPoint [dtc]

**Maintainer** Johannes Signer <jsigner@gwdg.de>

**Repository** CRAN

**Date/Publication** 2022-02-23 14:50:02 UTC

 amt-package

*amt: Animal Movement Tools*

---

## Description

Manage and analyze animal movement data. The functionality of 'amt' includes methods to calculate home ranges, track statistics (e.g. step lengths, speed, or turning angles), prepare data for fitting habitat selection analyses, and simulation of space-use from fitted step-selection functions.

amt\_fisher

*GPS tracks from four fishers*

---

**Description**

This file includes spatial data from 4 fisher (**Pekania pennanti**). These location data were collected via a 105g GPS tracking collar (manufactured by E-obs GmbH) and programmed to record the animal's location every 10 minutes, continuously. The data re projected in NAD84 (epsg: 5070). The data usage is permitted for exploratory purposes. For other purposes please get in contact (Scott LaPoint).

**Usage**

amt\_fisher

**Format**

A tibble with 14230 rows and 5 variables:

**x\_** the x-coordinate

**y\_** the y-coordinate

**t\_** the timestamp

**sex** the sex of the animal

**id** the id of the animal

**name** the name of the animal

**Source**

<https://www.datarepository.movebank.org/handle/10255/move.330>

**References**

---

amt\_fisher\_covar      *Environmental data for fishers*

---

**Description**

A list with three entries that correspond to the following three layer: land use, elevation and population density.

**Usage**

```
amt_fisher_covar
```

**Format**

A list with three where each entry is a RasterLayer.

**Source**

[https://lpdaac.usgs.gov/dataset\\_discovery/aster/aster\\_products\\_table](https://lpdaac.usgs.gov/dataset_discovery/aster/aster_products_table)

---

as\_sf\_lines      *Export track to lines*

---

**Description**

Exports a track to (multi)lines from the sf package.

**Usage**

```
as_sf_lines(x, ...)
```

**Arguments**

x	[track_xy, track_xyt] A track created with make_track.
...	Further arguments, none implemented.

**Value**

A tibble with a sfc-column

---

as_sf_points	<i>Coerces a track to points</i>
--------------	----------------------------------

---

**Description**

Coerces a track to points from the sf package.

**Usage**

```
as_sf_points(x, ...)

## S3 method for class 'steps_xy'
as_sf_points(x, end = TRUE, ...)
```

**Arguments**

x	[track_xy, track_xyt] A track created with make_track.
...	Further arguments, none implemented.
end	[logical(1)=TRUE] For steps, should the end or start points be used?

**Value**

A data data.frame with a sfc-column

---

as_track	<i>Coerce to track</i>
----------	------------------------

---

**Description**

Coerce other classes (currently implemented: SpatialPoints) to a track\_xy.

**Usage**

```
as_track(x, ...)

## S3 method for class 'SpatialPoints'
as_track(x, ...)

## S3 method for class 'sfc_POINT'
as_track(x, ...)

## S3 method for class 'steps_xyt'
as_track(x, ...)
```

```
## S3 method for class 'data.frame'
as_track(x, ...)
```

### Arguments

x                    Object to be converted to a track.  
 ...                  Further arguments, none implemented.

### Value

An object of class track\_xy(t)

### Examples

```
xy <- sp::SpatialPoints(cbind(c(1, 3, 2, 1), c(3, 2, 2, 1)))
as_track(xy)
```

---

available_distr	<i>Display available distributions for step lengths and turn angles.</i>
-----------------	--

---

### Description

Display available distributions for step lengths and turn angles.

### Usage

```
available_distr(which_dist = "all", names_only = FALSE, ...)
```

### Arguments

which\_dist          [char(1)="all"]{"all", "ta", "sl"}  
                     Should all distributions be returned, or only distributions for turn angles (ta)  
                     or step lengths (sl).  
 names\_only         [logical(1)=FALSE]  
                     Indicates if only the names of distributions should be returned.  
 ...                 none implemented.

### Value

A tibble with the purpose of the distribution (turn angles [ta] or step length [sl]) and the distribution name.

---

bandwidth_pi	hr_kde_pi wraps KernSmooth::dpik to select bandwidth for kernel density estimation the plug-in-the-equation method in two dimensions.
--------------	---

---

### Description

This function calculates bandwidths for kernel density estimation by wrapping KernSmooth::dpik. If correct = TRUE, the bandwidth is transformed with power 5/6 to correct for using an univariate implementation for bivariate data (Gitzen et. al 2006).

### Usage

```
hr_kde_pi(x, ...)

## S3 method for class 'track_xy'
hr_kde_pi(x, rescale = "none", correct = TRUE, ...)
```

### Arguments

x	[track_xy, track_xyt] A track created with make_track.
...	Further arguments, none implemented.
rescale	[character(1)] Rescaling method for reference bandwidth calculation. Must be one of "unitvar", "xvar", or "none".
correct	Logical scalar that indicates whether or not the estimate should be correct for the two dimensional case.

### Value

The bandwidth, the standardization method and correction.

### References

Gitzen, R. A., Millspaugh, J. J., & Kernohan, B. J. (2006). Bandwidth selection for fixed-kernel analysis of animal utilization distributions. *Journal of Wildlife Management*, 70(5), 1334-1344.

### See Also

KernSmooth::dpik

---

bandwidth_ref	<i>Reference bandwidth</i>
---------------	----------------------------

---

**Description**

Calculate the reference bandwidth for kernel density home-range range estimates.

**Usage**

```
hr_kde_ref(x, ...)

## S3 method for class 'track_xy'
hr_kde_ref(x, rescale = "none", ...)
```

**Arguments**

x	[track_xy, track_xyt] A track created with make_track.
...	Further arguments, none implemented.
rescale	[character(1)] Rescaling method for reference bandwidth calculation. Must be one of "unit-var", "xvar", or "none".

**Value**

The estimated bandwidth in x and y direction.

---

bbox	<i>Get bounding box of a track.</i>
------	-------------------------------------

---

**Description**

Get bounding box of a track.

**Usage**

```
bbox(x, ...)

## S3 method for class 'track_xy'
bbox(x, spatial = TRUE, buffer = NULL, sf = FALSE, ...)

## S3 method for class 'steps_xy'
bbox(x, spatial = TRUE, buffer = NULL, sf = FALSE, ...)
```

**Arguments**

x	[track_xy, track_xyt] A track created with make_track.
...	Further arguments, none implemented.
spatial	[logical(1)=TRUE] Whether or not to return a SpatialPolygons-object or not.
buffer	[numeric(0)=NULL]{NULL, >0} An optional buffer of the bounding box.
sf	[logical(1)=FALSE] If TRUE a simple feature polygon is returned.

**Value**

If spatial = FALSE a named vector of length four with the extent of the bounding box. Otherwise a SpatialPolygon or a simple feature polygon with the bounding box.

**Examples**

```
data(deer)
bbox(deer)
bbox(deer, spatial = FALSE)
bbox(deer, buffer = 100, spatial = FALSE)

# For steps
deer %>% steps_by_burst %>% bbox(spatial = FALSE)
deer %>% steps_by_burst %>% bbox(buffer = 100, spatial = FALSE)
deer %>% steps_by_burst %>% random_steps %>% bbox(spatial = FALSE)

# There is also the option to return a `sf`-object and then work with this further.
deer %>% bbox(sf = TRUE) %>% sf::st_transform(4326)
```

---

centroid

*Calculate the centroid of a track.*

---

**Description**

Calculate the centroid of a track.

**Usage**

```
centroid(x, ...)

## S3 method for class 'track_xy'
centroid(x, spatial = FALSE, ...)
```

**Arguments**

x [track\_xy, track\_xyt]  
A track created with `make_track`.

... Further arguments, none implemented.

spatial [logical(1)=FALSE]  
Whether or not to return a `SpatialPoints`-object.

**Value**

The centroid of a track as numeric vector if `spatial = FALSE`, otherwise as `SpatialPoints`.

**Examples**

```
data(deer)
centroid(deer)
```

---

coercion	<i>Coerce a track to other formats.</i>
----------	---

---

**Description**

Several other packages provides methods to analyze movement data, and `amt` provides coercion methods to some packages.

**Usage**

```
as_sp(x, ...)

## S3 method for class 'steps_xy'
as_sp(x, end = TRUE, ...)

as_move(x, ...)

## S3 method for class 'track_xyt'
as_move(x, id = "id", ...)

as_ltraj(x, ...)

## S3 method for class 'track_xy'
as_ltraj(x, id = "animal_1", ...)

## S3 method for class 'track_xyt'
as_ltraj(x, ...)

as_telemetry(x, ...)
```

```
## S3 method for class 'track_xyt'
as_telemetry(x, ...)

as_moveHMM(x, ...)

## S3 method for class 'track_xy'
as_moveHMM(x, ...)
```

### Arguments

x	[track_xy, track_xyt] A track created with make_track.
...	Further arguments, none implemented.
end	[logical(1)=TRUE] For steps, should the end or start points be used?
id	[numeric,character,factor] Animal id(s).

### Value

An object of the class to which coercion is performed to.

---

convert_angles	<i>Converts angles to radians</i>
----------------	-----------------------------------

---

### Description

Converts angles to radians

### Usage

```
as_rad(x)

as_degree(x)
```

### Arguments

x	[numeric] Angles in degrees or rad.
---	--

### Value

A numeric vector with the converted angles.

**Examples**

```
as_rad(seq(-180, 180, 30))

# The default unit of turning angles is rad.
data(deer)
deer %>% steps() %>% mutate(ta_ = as_degree(ta_))
```

---

coords	<i>Coordinates of a track.</i>
--------	--------------------------------

---

**Description**

Coordinates of a track.

**Usage**

```
coords(x, ...)
```

**Arguments**

x	[track_xy, track_xyt] A track created with <code>make_track</code> .
...	Further arguments, none implemented.

**Value**

[tibble]  
The coordinates.

**Examples**

```
data(deer)
coords(deer)
```

---

cum_ud	<i>Calculate a cumulative UD</i>
--------	----------------------------------

---

**Description**

Calculate the cumulative utilization distribution (UD).

**Usage**

```
hr_cud(x, ...)

## S3 method for class 'RasterLayer'
hr_cud(x, ...)
```

**Arguments**

x [RasterLayer]  
Containing the Utilization Distribution (UD).  
... Further arguments, none implemented.

**Value**

[RasterLayer]  
The cumulative UD.

**Note**

This function is typically used to obtain isopleths.

---

deer *Relocations of 1 red deer*

---

**Description**

826 GPS relocations of one red deer from northern Germany. The data is already resampled to a regular time interval of 6 hours and the coordinate reference system is transformed to epsg:3035.

**Usage**

deer

**Format**

A track\_xyt  
x\_ the x-coordinate  
y\_ the y-coordinate  
t\_ the timestamp  
burst\_ the burst a particular points belongs to.

**Source**

Verein für Wildtierforschung Dresden und Göttingen e.V.

---

diff	<i>Difference in x and y</i>
------	------------------------------

---

**Description**

Difference in x and y coordinates.

**Usage**

```
diff_x(x, ...)
```

```
diff_y(x, ...)
```

**Arguments**

x	A track_xyt.
...	Further arguments, none implemented.

**Value**

Numeric vector

---

dispersal_kernel	<i>Create a dispersal kernel</i>
------------------	----------------------------------

---

**Description**

Create a dispersal kernel

**Usage**

```
dispersal_kernel(  
  formula,  
  coefs,  
  habitat = NULL,  
  other.vars = NULL,  
  start,  
  max.dist,  
  init.dir = amt::as_rad(45),  
  standardize = TRUE,  
  raster = TRUE,  
  stop = 0  
)
```

**Arguments**

<code>formula</code>	[formula] The formula for the dispersal kernel.
<code>coefs</code>	[named numeric]{>1} Coefficients for the terms in the formula. Names of the coefficients must match the name of the terms.
<code>habitat</code>	[RasterLayer] The habitat matrix / landscape.
<code>other.vars</code>	[data.frame = NULL] Possible other covariates.
<code>start</code>	[numeric(2)] Coordinates of the start position.
<code>max.dist</code>	[numeric(1)] The maximum distance of the dispersal kernel.
<code>init.dir</code>	[numeric(1)] The initial direction in rad.
<code>standardize</code>	[logical(1) = TRUE] Should the result be standardized.
<code>raster</code>	[logical(1) = TRUE] Should a RasterLayer be returned.
<code>stop</code>	[integer(1)=1]{0,1} What happens when the animal steps out of the landscape.

**Value**

A list with the following entries

- `formula`: The formula used to construct the dispersal kernel.
- `coefs`: The selection coefficients.
- `habitat`: Habitat covariates used to construct the dispersal kernel.
- `other.var`: Other (time) varying covariates used to construct the dispersal kernel.
- `start`: The start position.
- `max.dist`: The maximum distance of the dispersal kernel.
- `init.dir`: The initial direction of the dispersal kernel.
- `standardize`: Whether or not the dispersal kernel was standardized.
- `raster`: Should a RasterLayer be returned.
- `stop`: What happens when the animal steps outside the landscape.
- `prep_dk`: Metrics for each cell in the dispersal kernel (e.g., step length, direction, ...)
- `dispersal_kernel`: A RasterLayer if `raster = TRUE` or a tibble of the dispersal kernel.

---

distributions                      *Functions create statistical distributions*

---

### Description

`make_distributions` creates a distribution suitable for using it with integrated step selection functions

### Usage

```
make_distribution(name, params, vcov = NULL, ...)

make_exp_distr(rate = 1)

make_hnorm_distr(sd = 1)

make_lnorm_distr(meanlog = 0, sdlog = 1)

make_unif_distr(min = -pi, max = pi)

make_vonmises_distr(kappa = 1, vcov = NULL)

make_gamma_distr(shape = 1, scale = 1, vcov = NULL)
```

### Arguments

<code>name</code>	[char(1)] Short name of distribution. See <code>available_distr()</code> for all currently implemented distributions.
<code>params</code>	[list] A named list with parameters of the distribution.
<code>vcov</code>	[matrix] A matrix with variance and covariances.
<code>...</code>	none implemented.
<code>rate</code>	[double(1)>0] The rate of the exponential distribution.
<code>sd</code>	[double(1)>0] The standard deviation of the half-normal distribution.
<code>meanlog</code>	[double(1)>0] The standard deviation of the half-normal distribution.
<code>sdlog</code>	[double(1)>0] The standard deviation of the half-normal distribution.
<code>min</code>	[double(1)] The minimum of the uniform distribution.
<code>max</code>	[double(1)] The minimum of the uniform distribution.

kappa	[double(1)>=0] Concentration parameter of the von Mises distribution.
shape, scale	[double(1)>=0] Shape and scale of the Gamma distribution

**Value**

A list of class `amt_distr` that contains the name (`name`) and parameters (`params`) of a distribution.

---

<code>distr_name</code>	<i>Name of step-length distribution and turn-angle distribution</i>
-------------------------	---

---

**Description**

Name of step-length distribution and turn-angle distribution

**Usage**

```
sl_distr_name(x, ...)

## S3 method for class 'random_steps'
sl_distr_name(x, ...)

## S3 method for class 'fit_clogit'
sl_distr_name(x, ...)

ta_distr_name(x, ...)

ta_distr_name(x, ...)

## S3 method for class 'random_steps'
ta_distr_name(x, ...)

## S3 method for class 'fit_clogit'
ta_distr_name(x, ...)
```

**Arguments**

<code>x</code>	Random steps or fitted model
<code>...</code>	None implemented.

**Value**

Character vector of length 1.

---

extent	<i>Extent of a track</i>
--------	--------------------------

---

**Description**

Obtain the extent of a track in x y or both directions

**Usage**

```
extent_x(x, ...)
```

```
extent_y(x, ...)
```

```
extent_both(x, ...)
```

```
extent_max(x, ...)
```

**Arguments**

x	[track_xy, track_xyt, steps] Either a track created with mk_track or track, or steps.
...	Further arguments, none implemented.

**Value**

Numeric vector with the extent.

---

extract_covariates	<i>Extract covariate values</i>
--------------------	---------------------------------

---

**Description**

Extract the covariate values at relocations, or at the beginning or end of steps.

**Usage**

```
extract_covariates(x, ...)
```

```
## S3 method for class 'track_xy'  
extract_covariates(x, covariates, ...)
```

```
## S3 method for class 'random_points'  
extract_covariates(x, covariates, ...)
```

```
## S3 method for class 'steps_xy'
```

```

extract_covariates(x, covariates, where = "end", ...)

extract_covariates_along(x, ...)

## S3 method for class 'steps_xy'
extract_covariates_along(x, covariates, ...)

extract_covariates_var_time(x, ...)

## S3 method for class 'track_xyt'
extract_covariates_var_time(
  x,
  covariates,
  when = "any",
  max_time,
  name_covar = "time_var_covar",
  ...
)

## S3 method for class 'steps_xyt'
extract_covariates_var_time(
  x,
  covariates,
  when = "any",
  max_time,
  name_covar = "time_var_covar",
  where = "end",
  ...
)

```

### Arguments

x	[track_xy, track_xyt, steps] Either a track created with <code>mk_track</code> or <code>track</code> , or <code>steps</code> .
...	Additional arguments passed to <code>raster::extract()</code> .
covariates	[RasterLayer, RasterStack, RasterBrick] The (environmental) covariates. For <code>extract_covariates_var_time</code> the argument <code>covariates</code> need to have a z-column (i.e. the time stamp).
where	[character(1)="end"] {"start", "end", "both"} For <code>steps</code> this determines if the covariate values should be extracted at the beginning or the end of a step. or end.
when	[character(1)="any"] {"any", "before", "after"} Specifies for for <code>extract_covariates_var_time</code> whether to look before, after or in both direction (any) for the temporally closest environmental raster.
max_time	[Period(1)] The maximum time difference between a relocation and the corresponding raster. If no rasters are within the specified max. distance NA is returned.

```
name_covar      [character(1)="time_var_covar"]
                The name of the new column.
```

### Details

extract\_covariates\_along extracts the covariates along a straight line between the start and the end point of a (random) step. It returns a list, which in most cases will have to be processed further.

### Value

A tibble with additional columns for covariate values.

### Examples

```
data(deer)
data(sh_forest)
mini_deer <- deer[1:20, ]
mini_deer %>% extract_covariates(sh_forest)
mini_deer %>% steps %>% extract_covariates(sh_forest)
mini_deer %>% steps %>% extract_covariates(sh_forest, where = "start")

# Buffer
mini_deer %>% extract_covariates(sh_forest) # no buffer
# The command buffer can be used, to buffer each point together with a
# function to summarize the results.
mini_deer %>% extract_covariates(sh_forest, buffer = 10, fun = mean)
# This can also be a use-specified function.
mini_deer %>% extract_covariates(sh_forest, buffer = 100, fun = function(x) length(x))

# Illustration of extracting covariates along the a step
mini_deer %>% steps() %>% random_steps() %>%
  extract_covariates(sh_forest) %>% # extract at the endpoint
  mutate(for_path = extract_covariates_along(., sh_forest)) %>%
  # 1 = forest, lets calc the fraction of forest along the path
  mutate(for_per = purrr::map_dbl(for_path, ~ mean(. == 1)))
```

---

filter\_min\_n\_burst      *Filter bursts by number of relocations*

---

### Description

Only retain bursts with a minimum number (= min\_n) of relocations.

### Usage

```
filter_min_n_burst(x, ...)

## S3 method for class 'track_xy'
filter_min_n_burst(x, min_n = 3, ...)
```

**Arguments**

x	[track_xy, track_xyt] A track created with make_track.
...	Further arguments, none implemented.
min_n	[numeric(1)=3] Indicating the minimum number of relocations (=fixes per burst).

**Value**

A tibble of class track\_xy(t).

---

fit_clogit	<i>Fit a conditional logistic regression</i>
------------	--

---

**Description**

This function is a wrapper around `survival::clogit`, making it usable in a piped workflow.

**Usage**

```
fit_clogit(data, formula, more = NULL, summary_only = FALSE, ...)
```

```
fit_ssf(data, formula, more = NULL, summary_only = FALSE, ...)
```

```
fit_issf(data, formula, more = NULL, summary_only = FALSE, ...)
```

**Arguments**

data	[data.frame] The data used to fit a model.
formula	[formula] The model formula.
more	[list] Optional list that is passed on the output.
summary_only	[logical(1)=FALSE] If TRUE only a broom::tidy summary of the model is returned.
...	Additional arguments, passed to survival::clogit.

**Value**

A list with the following entries

- model: The model output.
- sl\_: The step length distribution.
- ta\_: The turn angle distribution.

---

`fit_ctmm`*Fit a continuous time movement model with ctmm*

---

## Description

Fit a continuous time movement model with ctmm

## Usage

```
fit_ctmm(x, model, uere = NULL, ...)
```

## Arguments

<code>x</code>	[ <code>track_xyt</code> ] A track created with <code>make_track</code> that includes time.
<code>model</code>	[ <code>character(1) = "bm"</code> ]{ <code>"iid"</code> , <code>"bm"</code> , <code>"ou"</code> , <code>"ouf"</code> , <code>"auto"</code> } The autocorrelation model that should be fit to the data. <code>iid</code> corresponds to uncorrelated independent data, <code>bm</code> to Brownian motion, <code>ou</code> to an Ornstein-Uhlenbeck process, <code>ouf</code> to an Ornstein-Uhlenbeck forage process. <code>auto</code> will use model selection with AICc to find the best model.
<code>uere</code>	User Equivalent Range Error, see <code>?ctmm::uere</code> for more details.
<code>...</code>	Additional parameters passed to <code>ctmm::ctmm.fit</code> or <code>ctmm::ctmm.select</code> for <code>model = "auto"</code>

## Value

An object of class `ctmm` from the package `ctmm`.

## References

C. H. Fleming, J. M. Calabrese, T. Mueller, K.A. Olson, P. Leimgruber, W. F. Fagan, "From fine-scale foraging to home ranges: A semi-variance approach to identifying movement modes across spatiotemporal scales", *The American Naturalist*, 183:5, E154-E167 (2014).

## Examples

```
data(deer)
mini_deer <- deer[1:20, ]
m1 <- fit_ctmm(mini_deer, "iid")
summary(m1)
```

---

fit_distr	<i>Fit distribution to data</i>
-----------	---------------------------------

---

### Description

Wrapper to fit a distribution to data. Currently implemented distributions are the exponential distribution (`exp`), the gamma distribution (`gamma`) and the von Mises distribution (`vonmises`).

### Usage

```
fit_distr(x, dist_name, na.rm = TRUE)
```

### Arguments

<code>x</code>	[numeric(>1)] The observed data.
<code>dist_name</code>	[character(1)]{"exp", "gamma", "unif", "vonmises"} The name of the distribution.
<code>na.rm</code>	[logical(1)=TRUE] Indicating whether NA should be removed before fitting the distribution.

### Value

An `amt_distr` object, which consists of a list with the name of the distribution and its parameters (saved in `params`).

### Examples

```
set.seed(123)
dat <- rexp(1e3, 2)
fit_distr(dat, "exp")
```

---

fit_logit	<i>Fit logistic regression</i>
-----------	--------------------------------

---

### Description

This function is a wrapper around `stats::glm` for a piped workflows.

### Usage

```
fit_logit(data, formula, ...)

fit_rsf(data, formula, ...)
```

**Arguments**

data	[data.frame] The data used to fit a model.
formula	[formula] The model formula.
...	Further arguments passed to stats::glm.

**Value**

A list with the model output.

---

from_to	<i>Duration of tracks</i>
---------	---------------------------

---

**Description**

Function that returns the start (from), end (to), and the duration (from\_to) of a track.

**Usage**

```

from_to(x, ...)

## S3 method for class 'track_xyt'
from_to(x, ...)

from(x, ...)

## S3 method for class 'track_xyt'
from(x, ...)

to(x, ...)

## S3 method for class 'track_xyt'
to(x, ...)

```

**Arguments**

x	[track_xy, track_xyt] A track created with make_track.
...	Further arguments, none implemented.

**Value**

A vector of class POSIXct.

---

get_crs	<i>Obtains the Coordinate Reference Systems</i>
---------	---

---

**Description**

Returns the proj4string of an object.

**Usage**

```
get_crs(x, ...)
```

**Arguments**

x	[any] Object to check.
...	Further arguments, none implemented.

**Value**

The proj4string of the CRS.

**Examples**

```
data(deer)
get_crs(deer)
```

---

get_distr	<i>Obtain the step length and/or turn angle distributions from random steps or a fitted model.</i>
-----------	--

---

**Description**

Obtain the step length and/or turn angle distributions from random steps or a fitted model.

**Usage**

```
sl_distr(x, ...)

## S3 method for class 'random_steps'
sl_distr(x, ...)

## S3 method for class 'fit_clogit'
sl_distr(x, ...)

ta_distr(x, ...)
```

```
## S3 method for class 'random_steps'
ta_distr(x, ...)
```

```
## S3 method for class 'fit_clogit'
ta_distr(x, ...)
```

### Arguments

x	Random steps or fitted model
...	None implemented.

### Value

An amt distribution

---

habitat_kernel	<i>Simulate UD from fitted SSF</i>
----------------	------------------------------------

---

### Description

Function to obtain a habitat kernel from a fitted (i)SSF.

### Usage

```
habitat_kernel(coef, resources, exp = TRUE)
movement_kernel(scale, shape, template, quant = 0.99)
simulate_ud(movement_kernel, habitat_kernel, start, n = 100000L)
simulate_tud(movement_kernel, habitat_kernel, start, n = 100, n_rep = 5000)
```

### Arguments

coef	[list] Vector with coefficients, not yet implemented.
resources	[RasterLayer, RasterStack] The resources.
exp	A logical scalar, indicating whether or not the resulting habitat kernel should be exponentiated. This is usually TRUE.
scale, shape	[numeric](1) Scale and scale parameter of the gamma distribution of step lengths.
template	[RasterLayer, RasterStack] A raster serving as template for the simulations.
quant	A numeric scalar, quantile of the step-length distribution that is the maximum movement distance.

movement_kernel	[RasterLayer] The movement kernel.
habitat_kernel	[RasterLayer] The habitat kernel.
start	[numeric(2)] Starting point of the simulation.
n	[integer(1)=1e5] The number of simulation steps.
n_rep	[integer(1)=5e3]{>0} The number of times the animal walks of the final position. The mean of all replicates is returned.

### Details

`movement_kernel()`: calculates a movement kernel from a fitted (i)SSF. The method is currently only implemented for the gamma distribution.

The habitat kernel is calculated by multiplying resources with their corresponding coefficients from the fitted (i)SSF.

`simulate_ud()`: simulates a utilization distribution (UD) from a fitted Step-Selection Function.

`simulate_tud()`: Is a convenience wrapper around `simulate_ud` to simulate transition UD's (i.e., starting at the same position many times and only simulate for a short time).

### Value

A RasterLayer.

### Note

This functions are still experimental and should be used with care. If in doubt, please contact the author.

### Author(s)

---

has_crs	<i>Check for Coordinate Reference Systems (CRS)</i>
---------	---

---

**Description**

Checks if an object has a CRS.

**Usage**

```
has_crs(x, ...)
```

**Arguments**

x	[any] Object to check.
...	Further arguments, none implemented.

**Value**

Logic vector of length 1.

**Examples**

```
data(deer)
has_crs(deer)
```

---

hr_akde	<i>Home ranges</i>
---------	--------------------

---

**Description**

Functions to calculate animal home ranges from a track\_xy\*. hr\_mcp, hr\_kde, and hr\_locoh calculate the minimum convex polygon, kernel density, and local convex hull home range respectively.

**Usage**

```
hr_akde(x, ...)

## S3 method for class 'track_xyt'
hr_akde(
  x,
  model = fit_ctmm(x, "iid"),
  keep.data = TRUE,
  trast = make_trast(x),
  levels = 0.95,
  ...
)
```

```

)

hr_kde(x, ...)

## S3 method for class 'track_xy'
hr_kde(
  x,
  h = hr_kde_ref(x),
  trast = make_trast(x),
  levels = 0.95,
  keep.data = TRUE,
  ...
)

hr_locoh(x, ...)

## S3 method for class 'track_xy'
hr_locoh(
  x,
  n = 10,
  type = "k",
  levels = 0.95,
  keep.data = TRUE,
  rand_buffer = 1e-05,
  ...
)

hr_mcp(x, ...)

hr_od(x, ...)

```

### Arguments

x	[track_xy, track_xyt] A track created with <code>make_track</code> .
...	Further arguments, none implemented.
model	A continuous time movement model. This can be fitted either with <code>ctmm::ctmm.fit</code> or <code>fit_ctmm</code> .
keep.data	[logic(2)] Should the original tracking data be included in the estimate?
trast	[RasterLayer] A template raster for kernel density home-ranges.
levels	[numeric] The isopleth levels used for calculating home ranges. Should be $0 < \text{level} < 1$ .
h	[numeric(2)] The bandwidth for kernel density estimation.
n	[integer(1)] The number of neighbors used when calculating local convex hulls.

type	k, r or a. Type of LoCoH.
rand_buffer	[numeric(1)] Random buffer to avoid polygons with area 0 (if coordinates are numerically identical).

### Value

A hr-estimate.

### Examples

```
data(deer)
mini_deer <- deer[1:100, ]

# MCP -----
mcp1 <- hr_mcp(mini_deer)
hr_area(mcp1)

# calculated MCP at different levels
mcp1 <- hr_mcp(mini_deer, levels = seq(0.3, 1, 0.1))
hr_area(mcp1)

# CRS are inherited
get_crs(mini_deer)
mcps <- hr_mcp(mini_deer, levels = c(0.5, 0.95, 1))
has_crs(mcps)

# Kernel density estimaiton (KDE) -----
kde1 <- hr_kde(mini_deer)
hr_area(kde1)
get_crs(kde1)

# akde
data(deer)
mini_deer <- deer[1:20, ]
ud1 <- hr_akde(mini_deer) # uses an iid ctmm
ud2 <- hr_akde(mini_deer, model = fit_ctmm(deer, "ou")) # uses an OU ctmm

# od
```

```
data(deer)
ud1 <- hr_od(deer) # uses an iid ctmm
ud2 <- hr_akde(deer, model = fit_ctmm(deer, "ou")) # uses an OU ctmm
```

---

hr_area	<i>Home-range area</i>
---------	------------------------

---

### Description

Obtain the area of a home-range estimate, possible at different isopleth levels.

### Usage

```
hr_area(x, ...)

## S3 method for class 'hr'
hr_area(x, units = FALSE, ...)

## S3 method for class 'RasterLayer'
hr_area(x, level = 0.95, ...)

## S3 method for class 'akde'
hr_area(x, units = FALSE, ...)
```

### Arguments

x	An object of class hr
...	Further arguments, none implemented.
units	[logic(1)] Should areas be returned as units? If FALSE areas are returned as numeric values.
level	The level at which the area will be calculated.

### Value

A tibble with the home-range level and the area.

---

hr_isopleths	<i>Home-range isopleths</i>
--------------	-----------------------------

---

### Description

Obtain the isopleths of a home-range estimate, possible at different isopleth levels.

### Usage

```
hr_isopleths(x, ...)

## S3 method for class 'RasterLayer'
hr_isopleths(x, level, descending = TRUE, ...)

## S3 method for class 'mcp'
hr_isopleths(x, descending = TRUE, ...)

## S3 method for class 'locoh'
hr_isopleths(x, descending = TRUE, ...)

## S3 method for class 'hr_prob'
hr_isopleths(x, descending = TRUE, ...)

## S3 method for class 'akde'
hr_isopleths(x, conf.level = 0.95, descending = TRUE, ...)
```

### Arguments

x	An object of class hr
...	Further arguments, none implemented.
level	[numeric] The isopleth levels used for calculating home ranges. Should be $0 < \text{level} < 1$ .
descending	[logical = TRUE] Indicating if levels (and thus the polygons) should be ordered in descending (default) or not.
conf.level	The confidence level for isopleths for aKDE.

### Value

A tibble with the home-range level and a simple feature columns with the isopleth as multipolygon.

hr\_kde\_lscv

*Least square cross validation bandwidth***Description**

Use least square cross validation (lscv) to estimate bandwidth for kernel home-range estimation.

**Usage**

```
hr_kde_lscv(
  x,
  range = do.call(seq, as.list(c(hr_kde_ref(x) * c(0.1, 2), length.out = 100))),
  which_min = "global",
  rescale = "none",
  trast = raster(as_sp(x), nrow = 100, ncol = 100)
)
```

**Arguments**

x	[track_xy, track_xyt] A track created with make_track.
range	numeric vector with different candidate h values.
which_min	A character indicating if the global or local minimum should be searched for.
rescale	[character(1)] Rescaling method for reference bandwidth calculation. Must be one of "unitvar", "xvar", or "none".
trast	A template raster.

**Details**

hr\_kde\_lscv calculates least square cross validation bandwidth. This implementation is based on Seaman and Powell (1996). If whichMin is "global" the global minimum is returned, else the local minimum with the largest candidate bandwidth is returned.

**Value**

vector of length two.

**References**

Seaman, D. E., & Powell, R. A. (1996). An evaluation of the accuracy of kernel density estimators for home range analysis. *Ecology*, 77(7), 2075-2085.

---

 hr\_kde\_ref\_scaled      *Select a bandwidth for Kernel Density Estimation*

---

### Description

Use two dimensional reference bandwidth to select a bandwidth for kernel density estimation. Find the smallest value for bandwidth (h) that results in n polygons (usually n=1) contiguous polygons at a given level.

### Usage

```
hr_kde_ref_scaled(
  x,
  range = hr_kde_ref(x)[1] * c(0.01, 1),
  trast = make_trast(x),
  num.of.parts = 1,
  levels = 0.95,
  tol = 0.1,
  max.it = 500L
)
```

### Arguments

x	A track_xy*.
range	Numeric vector, indicating the lower and upper bound of the search range. If range is too large with regard to trast, the algorithm will fail.
trast	A template RasterLayer.
num.of.parts	Numeric numeric scalar, indicating the number of contiguous polygons desired. This will usually be one.
levels	The home range level.
tol	Numeric scalar, indicating which difference of to stop.
max.it	Numeric scalar, indicating the maximum number of acceptable iterations.

### Details

This implementation uses a bisection algorithm to find the smallest value for the kernel bandwidth within range that produces an home-range isopleth at level consisting of n polygons. Note, no difference is made between the two dimensions.

### Value

list with the calculated bandwidth, exit status and the number of iteration.

### References

Kie, John G. "A rule-based ad hoc method for selecting a bandwidth in kernel home-range analyses." *Animal Biotelemetry* 1.1 (2013): 1-12.

hr\_overlaps

*Methods to calculate home-range overlaps***Description**

Methods to calculate the overlap of two or more home-range estimates.

**Usage**

```
hr_overlap(x, ...)

## S3 method for class 'hr'
hr_overlap(x, y, type = "hr", conditional = FALSE, ...)

## S3 method for class 'list'
hr_overlap(
  x,
  type = "hr",
  conditional = FALSE,
  which = "consecutive",
  labels = NULL,
  ...
)
```

**Arguments**

x, y	A home-range estimate
...	Further arguments, none implemented.
type	[character](1) Type of index, should be one of hr, phr, vi, ba, udoi, or hd.
conditional	[logical](1) Whether or not conditional UDs are used. If TRUE levels from that were used to estimate home ranges will be used.
which	[character = "consecutive"] Should only consecutive overlaps be calculated or all combinations?
labels	[character=NULL] Labels for different instances. If NULL (the default) numbers will be used.

**Value**

data.frame with the isopleth level and area in units of the coordinate reference system.

---

hr_overlap_feature	<i>Calculate the overlap between a home-range estimate and a polygon</i>
--------------------	--

---

**Description**

Sometimes the percentage overlap between a spatial polygon and a home-range is required.

**Usage**

```
hr_overlap_feature(x, sf, direction = "hr_with_feature", feature_names = NULL)
```

**Arguments**

x	A home-range estimate.
sf	An object of class sf containing polygons
direction	The direction.
feature_names	optional feature names

**Value**

A tibble

---

hr_to_sf	<i>Convert home ranges to sfc</i>
----------	-----------------------------------

---

**Description**

Convert a list column with many home-range estimates to a tibble with a geometry column (as used by the sf-package).

**Usage**

```
hr_to_sf(x, ...)

## S3 method for class 'tbl_df'
hr_to_sf(x, col, ...)
```

**Arguments**

x	A tibble with a list column with individual home ranges.
...	Additional columns that should be transferred to the new tibble.
col	The column where the home

**Value**

A data.frame with a simple feature column (from the sf) package.

**Examples**

```
data("amt_fisher")
hr <- amt_fisher %>% nest(data = -id) %>%
  mutate(hr = map(data, hr_mcp), n = map_int(data, nrow)) %>%
  hr_to_sf(hr, id, n)
```

```
hr <- amt_fisher %>% nest(data = -id) %>%
  mutate(hr = map(data, hr_kde), n = map_int(data, nrow)) %>%
  hr_to_sf(hr, id, n)
```

---

hr\_ud

*Obtain the utilization distribution of a probabilistic home range*

---

**Description**

Obtain the utilization distribution of a probabilistic home range

**Usage**

```
hr_ud(x, ...)
```

**Arguments**

x	[hr_prob] The home-range estimate
...	Further arguments, none implemented.

**Value**

RasterLayer

---

inspect	<i>Inspect a track</i>
---------	------------------------

---

**Description**

Provides a very basic interface to leaflet and lets the user inspect relocations on an interactive map.

**Usage**

```
inspect(x, ...)  
  
## S3 method for class 'track_xy'  
inspect(x, popup = NULL, cluster = TRUE, ...)
```

**Arguments**

x	[track_xy, track_xyt] A track created with make_track.
...	Further arguments, none implemented.
popup	[character(nrow(x))] Optional labels for popups.
cluster	[logical(1)] If TRUE points are clustered at lower zoom levels.

**Value**

An interactive leaflet map.

**Note**

Important, x requires a valid coordinate reference system.

**See Also**

leaflet::leaflet()

**Examples**

```
data(sh)  
x <- track(x = sh$x, y = sh$y, crs = 31467)  
  
inspect(x)  
inspect(x, cluster = FALSE)  
inspect(x, popup = 1:nrow(x), cluster = FALSE)
```

---

log\_rss

*Calculate log-RSS for a fitted model*

---

**Description**

Calculate log-RSS( $x_1$ ,  $x_2$ ) for a fitted RSF or (i)SSF

**Usage**

```
log_rss(object, ...)

## S3 method for class 'glm'
log_rss(object, x1, x2, ci = NA, ci_level = 0.95, n_boot = 1000, ...)

## S3 method for class 'fit_clogit'
log_rss(object, x1, x2, ci = NA, ci_level = 0.95, n_boot = 1000, ...)
```

**Arguments**

object	[fit_logit, fit_clogit] A fitted RSF or (i)SSF model.
...	Further arguments, none implemented.
x1	[data.frame] A data.frame representing the habitat values at location $x_1$ . Must contain all fitted covariates as expected by <code>predict()</code> .
x2	[data.frame] A 1-row data.frame representing the single hypothetical location of $x_2$ . Must contain all fitted covariates as expected by <code>predict()</code> .
ci	[character] Method for estimating confidence intervals around log-RSS. NA skips calculating CIs. Character string "se" uses standard error method and "boot" uses empirical bootstrap method.
ci_level	[numeric] Level for confidence interval. Defaults to 0.95 for a 95% confidence interval.
n_boot	[integer] Number of bootstrap samples to estimate confidence intervals. Ignored if <code>ci != "boot"</code> .

**Details**

This function assumes that the user would like to compare relative selection strengths from at least one proposed location ( $x_1$ ) to exactly one reference location ( $x_2$ ).

The objects `object$model`, `x1`, and `x2` will be passed to `predict()`. Therefore, the columns of `x1` and `x2` must match the terms in the model formula exactly.

**Value**

Returns a list of class `log_rss` with four entries:

- `df`: A data.frame with the covariates and the `log_rss`
- `x1`: A data.frame with covariate values for `x1`.
- `x2`: A data.frame with covariate values for `x2`.
- `formula`: The formula used to fit the model.

---

movement\_metrics

*Movement metrics*

---

## Description

Functions to calculate metrics such as straightness, mean squared displacement (msd), intensity use, sinuosity, mean turn angle correlation (tac) of a track.

## Usage

```
straightness(x, ...)
```

```
cum_dist(x, ...)
```

```
tot_dist(x, ...)
```

```
msd(x, ...)
```

```
intensity_use(x, ...)
```

```
sinuosity(x, ...)
```

```
tac(x, ...)
```

## Arguments

x	[track_xy, track_xyt] A track created with make_track.
...	Further arguments, none implemented.

## Details

The intensity use is calculated by dividing the total movement distance (tot\_dist) by the square of the area of movement (= minimum convex polygon 100).

## Value

A numeric vector of length one.

intensity_use(deer)
```

---

nsd	<i>Net squared displacement (nsd)</i>
-----	---------------------------------------

---

## Description

The function `nsd()` calculates the net squared displacement (i.e., the squared distance from the first location of a track) for a track. The function `add_nsd()` add a new column to a track or steps object with the `nsd` (the column name is `nsd_`).

## Usage

```
nsd(x, ...)
```

```
## S3 method for class 'track_xy'
nsd(x, ...)
```

```
add_nsd(x, ...)
```

```
## S3 method for class 'track_xy'
add_nsd(x, ...)
```

```
## S3 method for class 'steps_xy'
add_nsd(x, ...)
```

model	[An output of fit_ctmm] The autocorrelation model that should be fit to the data. bm corresponds to Brownian motion, ou to an Ornstein-Uhlenbeck process, ouf to an Ornstein-Uhlenbeck forage process.
res.space	[numeric(1)=10] Number of grid point along each axis, relative to the average diffusion (per median timestep) from a stationary point. See also help(ctmm: occurrence).
res.time	[numeric(1)=10] Number of temporal grid points per median timestep.
n.points	[numeric(1)=5] This argument is only relevant for rolling_od and specifies the window size for the od estimation.
show.progress	[logical(1)=TRUE] Indicates if a progress bar is used.

Fleming, C. H., Fagan, W. F., Mueller, T., Olson, K. A., Leimgruber, P., & Calabrese, J. M. (2016). Estimating where and how animals travel: an optimal framework for path reconstruction from autocorrelated tracking data. *Ecology*.

## Examples

```
data(deer)
mini_deer <- deer[1:100, ]
trast <- make_trast(mini_deer)
md <- od(mini_deer, trast = trast)
raster::plot(md)

# rolling ud
xx <- rolling_od(mini_deer, trast)
```

---

params

*Get parameters from a (fitted) distribution*

---

## Description

Get parameters from a (fitted) distribution

## Usage

```
sl_distr_params(x, ...)

## S3 method for class 'random_steps'
sl_distr_params(x, ...)
```

```
## S3 method for class 'fit_clogit'
sl_distr_params(x, ...)

ta_distr_params(x, ...)

## S3 method for class 'random_steps'
ta_distr_params(x, ...)

## S3 method for class 'fit_clogit'
ta_distr_params(x, ...)
```

### Arguments

x	[amt_distr] A (fitted) distribution
...	None

### Value

A list with the parameters of the distribution.

### Examples

```
data(deer)
d <- deer %>% steps() %>% random_steps()
sl_distr_params(d)
ta_distr_params(d)
```

---

plot.hr	<i>Plot a home-range estimate</i>
---------	-----------------------------------

---

### Description

Plot a home-range estimate

### Usage

```
## S3 method for class 'hr'
plot(x, add.relocations = TRUE, ...)
```

### Arguments

x	A home-range estimate.
add.relocations	logical(1) indicates if a relocations should be added to the plot.
...	Further arguments, none implemented.

**Value**

A plot

---

plot.log_rss	<i>Plot a log_rss object</i>
--------------	------------------------------

---

**Description**

Default plot method for an object of class log\_rss

**Usage**

```
## S3 method for class 'log_rss'
plot(x, x_var1 = "guess", x_var2 = "guess", ...)
```

**Arguments**

x	[log_rss] An object returned by the function <code>log_rss()</code> .
x_var1	[character] The variable to plot on the x-axis. A string of either "guess" (default – see Details) or the variable name.
x_var2	[character] A second predictor variable to include in the plot. Either "guess" (default – see Details), NA, or the variable name.
...	[any] Additional arguments to be passed to <code>\link{plot}()</code> . <i>Not currently implemented.</i>

**Details**

This function provides defaults for a basic plot, but we encourage the user to carefully consider how to represent the patterns found in their habitat selection model.

The function `log_rss()` is meant to accept a user-defined input for x1. The structure of x1 likely reflects how the user intended to visualize the results. Therefore, it is possible to "guess" which covariate the user would like to see on the x-axis by choosing the column from x1 with the most unique values. Similarly, if there is a second column with multiple unique values, that could be represented by a color. Note that if the user needs to specify x\_var1, then we probably cannot guess x\_var2. Therefore, if the user specifies `x_var1 != "guess" & x_var2 == "guess"`, the function will return an error.

This function uses integers to represent colors, and therefore the user can change the default colors by specifying a custom `palette()` before calling the function.

**Value**

A plot.

**Examples**

```

# Load data
data("amt_fisher")
data("amt_fisher_covar")

# Prepare data for RSF
rsf_data <- amt_fisher %>%
  filter(name == "Leroy") %>%
  make_track(x_, y_, t_) %>%
  random_points() %>%
  extract_covariates(amt_fisher_covar$landuse) %>%
  mutate(lu = factor(landuse))

# Fit RSF
m1 <- rsf_data %>%
  fit_rsf(case_ ~ lu)

# Calculate log-RSS
# data.frame of x1s
x1 <- data.frame(lu = sort(unique(rsf_data$lu)))
# data.frame of x2 (note factor levels should be same as model data)
x2 <- data.frame(lu = factor(140,
  levels = levels(rsf_data$lu)))
# Calculate
logRSS <- log_rss(object = m1, x1 = x1, x2 = x2)

# Plot
plot(logRSS)

```

---

plot\_sl

*Plot step-length distribution*

---

**Description**

Plot step-length distribution

**Usage**

```

plot_sl(x, ...)

## S3 method for class 'fit_clogit'
plot_sl(x, n = 1000, upper_quantile = 0.99, plot = TRUE, ...)

## S3 method for class 'random_steps'
plot_sl(x, n = 1000, upper_quantile = 0.99, plot = TRUE, ...)

```

**Arguments**

x	[fit_clogit random_steps] A fitted step selection or random steps.
...	Further arguments, none implemented.
n	[numeric(1)=1000]{>0} The number of breaks between 0 and upper_quantile.
upper_quantile	[numeric(1)=0.99]{0-1} The quantile until where the distribution should be plotted. Typically this will be 0.95 or 0.99.
plot	[logical(1)=TRUE] Indicates if a plot should be drawn or not.

**Value**

A plot of the step-length distribution.

**Examples**

```
data(deer)

# with random steps
deer %>% steps_by_burst %>% random_steps %>% plot_sl
deer %>% steps_by_burst %>% random_steps %>% plot_sl(upper_quantile = 0.5)

# with fitted ssf
deer %>% steps_by_burst %>% random_steps %>%
  fit_ssf(case_ ~ sl_ + strata(step_id_)) %>% plot_sl
```

---

random_numbers	<i>Sample random numbers</i>
----------------	------------------------------

---

**Description**

Sample random numbers from a distribution created within the amt package.

**Usage**

```
random_numbers(x, n = 100, ...)
```

**Arguments**

x	[amt_distr] A distribution object.
n	[integer(1)=100]{>0} The number of random draws.
...	none implemented.

**Value**

A numeric vector.

---

random_points	<i>Generate random points</i>
---------------	-------------------------------

---

**Description**

Functions to generate random points within an animals home range. This is usually the first step for investigating habitat selection via Resource Selection Functions (RSF).

**Usage**

```
random_points(x, ...)

## S3 method for class 'hr'
random_points(x, n = 100, type = "random", presence = NULL, ...)

## S3 method for class 'sf'
random_points(x, n = 100, type = "random", presence = NULL, ...)

## S3 method for class 'SpatialPolygons'
random_points(x, n = 100, type = "random", presence = NULL, ...)

## S3 method for class 'track_xy'
random_points(x, level = 1, hr = "mcp", n = nrow(x) * 10, type = "random", ...)
```

**Arguments**

x	[track_xy, track_xyt] A track created with make_track.
...	[any] None implemented.
n	[integer(1)] The number of random points.
type	[character(1)] Argument passed to sp::spsample type. The default is random.
presence	[track] The presence points, that will be added to the result.
level	[numeric(1)] Home-range level of the minimum convex polygon, used for generating the background samples.
hr	[character(1)] The home range estimator to be used. Currently only MCP is implemented.

**Value**

A tibble with the observed and random points and a new column `case_` that indicates if a point is observed (`case_ = TRUE`) or random (`case_ = FALSE`).

**Note**

For objects of class `track_xyt` the timestamp (`t_`) is lost.

**Examples**

```
data(deer)

# track_xyt -----
# Default settings
rp1 <- random_points(deer)

plot(rp1)

trast <- raster(bbox(deer, buffer = 5000), res = 30)
rp3 <- random_points(deer, hr = "kde", trast = trast) # we need a larger template raster

plot(rp3)

# Ten random points for each observed point
rp <- random_points(deer, n = nrow(deer) * 10)
plot(rp)

# Within a home range -----
hr <- hr_mcp(deer, level = 1)

# 100 random point within the home range
rp <- random_points(hr, n = 100)
plot(rp)

# 100 regular point within the home range
rp <- random_points(hr, n = 100, type = "regular")
plot(rp)

# 100 hexagonal point within the home range
rp <- random_points(hr, n = 100, type = "hexagonal")
plot(rp)
```

**Description**

Function to generate a given number of random steps for each observed step.

**Usage**

```
random_steps(x, ...)

## S3 method for class 'numeric'
random_steps(
  x,
  n_control = 10,
  angle = 0,
  rand_sl = random_numbers(make_exp_distr(), n = 1e+05),
  rand_ta = random_numbers(make_unif_distr(), n = 1e+05),
  ...
)

## S3 method for class 'steps_xy'
random_steps(
  x,
  n_control = 10,
  sl_distr = fit_distr(x$sl_, "gamma"),
  ta_distr = fit_distr(x$ta_, "vonmises"),
  rand_sl = random_numbers(sl_distr, n = 1e+05),
  rand_ta = random_numbers(ta_distr, n = 1e+05),
  include_observed = TRUE,
  ...
)
```

**Arguments**

x	Steps.
...	Further arguments, none implemented.
n_control	[integer(1)=10]{>1} The number of control steps paired with each observed step.
angle	[numeric(1) = 0]{-pi < rel_angle < pi} Angle for the first step.
rand_sl	[numeric] Numeric vector with random step lengths an animal can make. This will usually be random numbers drawn from a suitable distribution (e.g., gamma or exponential).
rand_ta	[numeric] Numeric vector with relative turning angles an animal can make. This will usually be random numbers drawn from a suitable distribution (e.g., von Mises or uniform).
sl_distr	[amt_distr] The step-length distribution.

`ta_distr`            `[amt_distr]`  
                          The turn-angle distribution.  
`include_observed`  
                          `[logical(1) = TRUE]`  
                          Indicates if observed steps are to be included in the result.

**Value**

A tibble of class `random_steps`.

---

<code>range</code>	<i>Geographic range</i>
--------------------	-------------------------

---

**Description**

The range that in either x, y or both directions, that a track covers.

**Usage**

```

range_x(x, ...)

## S3 method for class 'track_xy'
range_x(x, ...)

range_y(x, ...)

## S3 method for class 'track_xy'
range_y(x, ...)

range_both(x, ...)

## S3 method for class 'track_xy'
range_both(x, ...)
  
```

**Arguments**

`x`                    `[track_xy, track_xyt]`  
                          A track created with `make_track`.  
`...`                 Further arguments, none implemented.

**Value**

Numeric vector with the range.

---

remove_capture	<i>Removes Capture Effects</i>
----------------	--------------------------------

---

**Description**

Removing relocations at the beginning and/or end of a track, that fall within a user specified period.

**Usage**

```
remove_capture_effect(x, ...)

## S3 method for class 'track_xyt'
remove_capture_effect(x, start, end, ...)
```

**Arguments**

x	An object of class track_xyt.
...	Further arguments, none implemented.
start	A lubirdate::Period, indicating the time period to be removed at the beginning of the track.
end	A lubirdate::Period, indicating the time period to be removed at the end of the track.

**Value**

A tibble without observations that fall within the period of the capture effect.

---

remove_incomplete_strata	<i>Remove strata with missing values for observed steps</i>
--------------------------	---

---

**Description**

Remove strata with missing values for observed steps

**Usage**

```
remove_incomplete_strata(x, ...)

## S3 method for class 'random_steps'
remove_incomplete_strata(x, col = "ta_", ...)
```

**Arguments**

`x` An object of class `random_steps`.  
`...` Further arguments, none implemented.  
`col` A character with the column name that will be scanned for missing values.

**Value**

An object of class `random_steps`, where observed steps (`case_ == TRUE`) with missing values (NA) in the column `col` are removed (including all random steps).

**Examples**

```
mini_deer <- deer[1:4, ]

# The first step is removed, because we have `NA` turn angles.
mini_deer %>% steps() %>% random_steps() %>% remove_incomplete_strata() %>%
  select(case_, ta_, step_id_)
```

---

sh

*Relocations of one Red Deer*

---

**Description**

1500 GPS relocations of one red deer from northern Germany.

**Usage**

```
sh
```

**Format**

A data frame with 1500 rows and 4 variables:

**x\_epsg31467** the x-coordinate

**y\_epsg31467** the y-coordinate

**day** the day of the relocation

**time** the hour of the relocation

**Source**

Verein für Wildtierforschung Dresden und Göttingen e.V.

---

sh_forest	<i>Forest cover</i>
-----------	---------------------

---

**Description**

Forest cover for the home range of one red deer in northern Germany.

**Usage**

```
sh_forest
```

**Format**

A RasterLayer

**1** forest

**2** non-forest

**Source**

JRC

**References**

A. Pekkarinen, L. Reithmaier, P. Strobl (2007): Pan-European Forest/Non-Forest mapping with Landsat ETM+ and CORINE Land Cover 2000 data.

---

simulate_ud_from_dk	<i>Simulate a UD from a dispersal kernel</i>
---------------------	--

---

**Description**

Simulate a UD from a dispersal kernel

**Usage**

```
simulate_ud_from_dk(obj, n = 1000, other.vars = NULL)
```

**Arguments**

obj	A dispersal kernel
n	Number of time steps
other.vars	other covariates for each time step.

**Value**

A raster layer.

---

simulate_xy	<i>Simulate a trajectory</i>
-------------	------------------------------

---

**Description**

Simulate a trajectory

**Usage**

```
simulate_xy(obj, n = 100, other.vars = NULL)
```

**Arguments**

obj	A dispersal kernel.
n	Number of time steps.
other.vars	Other covariates (for each time step).

**Value**

A tibble with the coordinates of the simulated path.

---

site_fidelity	<i>Test for site fidelity of animal movement.</i>
---------------	---

---

**Description**

Calculates two indices (mean squared displacement and linearity) to test for site fidelity. Significance testing is done by permuting step lengths and drawing turning angles from a uniform distribution.

**Usage**

```
site_fidelity(x, ...)

## S3 method for class 'steps_xy'
site_fidelity(x, n = 100, alpha = 0.05, ...)
```

**Arguments**

x	A track
...	None implemented
n	Numeric scalar. The number of simulated trajectories.
alpha	Numeric scalar. The alpha value used for the bootstrapping.

**Value**

A list of length 4. `msd_dat` and `li_dat` is the mean square distance and linearity for the real data. `msd_sim` and `li_sim` are the mean square distances and linearities for the simulated trajectories.

**References**

Spencer, S. R., Cameron, G. N., & Swihart, R. K. (1990). Operationally defining home range: temporal dependence exhibited by hispid cotton rats. *Ecology*, 1817-1822.

**Examples**

```
# real data

data(deer)
ds <- deer %>% steps_by_burst()
site_fidelity(ds)
```

---

speed

*Speed*

---

**Description**

Obtain the speed of a track.

**Usage**

```
speed(x, ...)

## S3 method for class 'track_xyt'
speed(x, append_na = TRUE, ...)
```

**Arguments**

<code>x</code>	A <code>track_xyt</code> .
<code>...</code>	Further arguments, none implemented.
<code>append_na</code>	[logical(1)=TRUE] Should an NA be appended at the end.

**Value**

[numeric]  
The speed in m/s.

---

 steps

*Functions to create and work with steps*

---

### Description

step\_lengths can be use to calculate step lengths of a track. direction\_abs and direction\_rel calculate the absolute and relative direction of steps. steps converts a track\_xy\* from a point representation to a step representation and automatically calculates step lengths and relative turning angles.

### Usage

```
direction_abs(x, ...)
```

```
## S3 method for class 'track_xy'
```

```
direction_abs(
  x,
  full_circle = FALSE,
  zero_dir = "E",
  clockwise = FALSE,
  append_last = TRUE,
  lonlat = FALSE,
  ...
)
```

```
direction_rel(x, ...)
```

```
## S3 method for class 'track_xy'
```

```
direction_rel(x, lonlat = FALSE, append_last = TRUE, zero_dir = "E", ...)
```

```
step_lengths(x, ...)
```

```
## S3 method for class 'track_xy'
```

```
step_lengths(x, lonlat = FALSE, append_last = TRUE, ...)
```

```
steps_by_burst(x, ...)
```

```
## S3 method for class 'track_xyt'
```

```
steps_by_burst(x, lonlat = FALSE, keep_cols = NULL, ...)
```

```
steps(x, ...)
```

```
## S3 method for class 'track_xy'
```

```
steps(x, lonlat = FALSE, keep_cols = NULL, ...)
```

```
## S3 method for class 'track_xyt'
```

```
steps(x, lonlat = FALSE, keep_cols = NULL, diff_time_units = "auto", ...)
```

**Arguments**

<code>x</code>	[ <code>track_xy</code> , <code>track_xyt</code> ] A track created with <code>make_track</code> .
<code>...</code>	Further arguments, none implemented
<code>full_circle</code>	[ <code>logical(1)=FALSE</code> ] If TRUE angles are returned between 0 and $2\pi$ , otherwise angles are between $-\pi$ and $\pi$ .
<code>zero_dir</code>	[ <code>character(1)='E'</code> ] Indicating the zero direction. Must be either N, E, S, or W.
<code>clockwise</code>	[ <code>logical(1)=FALSE</code> ] Should angles be calculated clock or anti-clockwise?
<code>append_last</code>	[ <code>logical(1)=TRUE</code> ] If TRUE an NA is appended at the end of all angles.
<code>lonlat</code>	[ <code>logical(1)=TRUE</code> ] Should geographical or planar coordinates be used? If TRUE geographic distances are calculated.
<code>keep_cols</code>	[ <code>character(1)=NULL</code> ]{ <code>'start'</code> , <code>'end'</code> , <code>'both'</code> } Should columns with attribute information be transferred to steps? If <code>keep_cols = 'start'</code> the attributes from the starting point are use, otherwise the columns from the end points are used.
<code>diff_time_units</code>	[ <code>character(1)='auto'</code> ] The unit for time differences, see <code>?difftime</code> .

**Details**

`directions_*`() returns NA for 0 step lengths.

`step_lengths` calculates the step lengths between points a long the path. The last value returned is NA, because no observed step is 'started' at the last point. If `lonlat = TRUE`, `step_lengths()` wraps `raster::pointDistance()`.

**Value**

[`numeric`]  
For `step_lengths()` and `direction_*` a numeric vector.  
[`data.frame`]  
For `steps` and `steps_by_burst`, containing the steps.

**Examples**

```
xy <- tibble(
  x = c(1, 4, 8, 8, 12, 12, 8, 0, 0, 4, 2),
  y = c(0, 0, 0, 8, 12, 12, 12, 12, 8, 4, 2))
trk <- make_track(xy, x, y)

# append last
direction_abs(trk, append_last = TRUE)
```

```

direction_abs(trk, append_last = FALSE)

# degrees
direction_abs(trk) %>% as_degree

# full circle or not: check
direction_abs(trk, full_circle = TRUE)
direction_abs(trk, full_circle = FALSE)
direction_abs(trk, full_circle = TRUE) %>% as_degree()
direction_abs(trk, full_circle = FALSE) %>% as_degree()

# direction of 0
direction_abs(trk, full_circle = TRUE, zero_dir = "N")
direction_abs(trk, full_circle = TRUE, zero_dir = "E")
direction_abs(trk, full_circle = TRUE, zero_dir = "S")
direction_abs(trk, full_circle = TRUE, zero_dir = "W")

# clockwise or not
direction_abs(trk, full_circle = TRUE, zero_dir = "N", clockwise = FALSE)
direction_abs(trk, full_circle = TRUE, zero_dir = "N", clockwise = TRUE)

# Bearing (i.e. azimuth): only for lon/lat
direction_abs(trk, full_circle = FALSE, zero_dir = "N", lonlat = FALSE, clockwise = TRUE)
direction_abs(trk, full_circle = FALSE, zero_dir = "N", lonlat = TRUE, clockwise = TRUE)

```

---

```
summarize_sampling_rate
```

*Returns a summary of sampling rates*

---

## Description

Returns a summary of sampling rates

## Usage

```

summarize_sampling_rate(x, ...)

## S3 method for class 'track_xyt'
summarize_sampling_rate(
  x,
  time_unit = "auto",
  summarize = TRUE,
  as_tibble = TRUE,
  ...
)

summarize_sampling_rate_many(x, ...)

```

```
## S3 method for class 'track_xyt'
summarize_sampling_rate_many(x, cols, time_unit = "auto", ...)
```

### Arguments

x	A track_xyt.
...	Further arguments, none implemented.
time_unit	[character(1) = "auto"] Which time unit will be used.
summarize	A logical. If TRUE a summary is returned, otherwise raw sampling intervals are returned.
as_tibble	A logical. Should result be returned as tibble or as table.
cols	Columns used for grouping.

### Value

Depending on summarize and as\_tibble, a vector, table or tibble.

### Examples

```
data(deer)
amt::summarize_sampling_rate(deer)

data(amt_fisher)
# Add the month
amt_fisher %>% mutate(yday = lubridate::yday(t_)) %>%
summarize_sampling_rate_many(c("id", "yday"))
```

---

time_of_day	<i>Time of the day when a fix was taken</i>
-------------	---

---

### Description

A convenience wrapper around `mapprools::sunriseset` and `mapprools::crepuscule` to extract if a fix was taken during day or night (optionally also include dawn and dusk).

### Usage

```
time_of_day(x, ...)

## S3 method for class 'track_xyt'
time_of_day(x, solar.dep = 6, include.crepuscule = FALSE, ...)

## S3 method for class 'steps_xyt'
time_of_day(x, solar.dep = 6, include.crepuscule = FALSE, where = "end", ...)
```

**Arguments**

x	[track_xy,steps_xy] A track or steps.
...	Further arguments, none implemented.
solar.dep	[numeric(1,n)=6] The angle of the sun below the horizon in degrees. Passed to <code>maptools::crepuscule</code> .
include.crepuscule	[logical(1)=TRUE] Should dawn and dusk be included.
where	[character(1)="end"]{"start", "end", "both"} For steps, should the start, end or both time points be used?

**Value**

A tibble with an additional column `tod_` that contains the time of the day for each relocation.

**Examples**

```
data(deer)
deer %>% time_of_day()
deer %>% steps_by_burst %>% time_of_day()
deer %>% steps_by_burst %>% time_of_day(where = "start")
deer %>% steps_by_burst %>% time_of_day(where = "end")
deer %>% steps_by_burst %>% time_of_day(where = "both")
```

---

track	<i>Create a track_*</i>
-------	-------------------------

---

**Description**

Constructor to create a track, the basic building block of the `amt` package. A track is usually created from a set of x and y coordinates, possibly time stamps, and any number of optional columns, such as id, sex, age, etc.

**Usage**

```
mk_track(
  tbl,
  .x,
  .y,
  .t,
  ...,
  crs = NA_crs_,
  order_by_ts = TRUE,
  check_duplicates = FALSE,
  all_cols = FALSE,
```

```

    verbose = FALSE
  )

make_track(
  tbl,
  .x,
  .y,
  .t,
  ...,
  crs = NA_crs_,
  order_by_ts = TRUE,
  check_duplicates = FALSE,
  all_cols = FALSE,
  verbose = FALSE
)

track(x, y, t, ..., crs = NULL)

```

### Arguments

<code>tbl</code>	[data.frame] The data.frame from which a track should be created.
<code>.x, .y, .t</code>	[expression(1)] Unquoted variable names of columns containing the x and y coordinates, and optionally a time stamp.
<code>...</code>	[expression] Additional columns from <code>tbl</code> to be used in a track. Columns should be provided in the form of <code>key = val</code> (e.g., for <code>ids</code> this may look like <code>this id = c(1, 1, 1, 2, 2, 2</code> for three points for <code>ids</code> 1 and 2 each).
<code>crs</code>	[crs] An optional coordinate reference system of the points. Usually just the <code>epsg</code> code is sufficient.
<code>order_by_ts</code>	[logical(1)] Should relocations be ordered by time stamp, default is <code>TRUE</code> .
<code>check_duplicates</code>	[logical(1)=FALSE] Should it be checked if there are duplicated time stamp, default is <code>FALSE</code> .
<code>all_cols</code>	[logical(1)=FALSE] Should all columns be carried over to the track object, default is <code>FALSE</code> .
<code>verbose</code>	[logical(1)=FALSE] Inform when tracks are created.
<code>x, y</code>	[numeric] The x and y coordinates.
<code>t</code>	[POSIXct] The time stamp.

**Value**

If `t` was provided an object of class `track_xyt` is returned otherwise a `track_xy`.

---

<code>track_align</code>	<i>Selects relocations that fit a new time series</i>
--------------------------	---

---

**Description**

Functions to only selects relocations that can be aligned with a new time series (within some tolerance).

**Usage**

```
track_align(x, ...)

## S3 method for class 'track_xyt'
track_align(x, nt, tol, ...)
```

**Arguments**

<code>x</code>	A track.
<code>...</code>	Further arguments, none implemented.
<code>nt</code>	The new time trajectory.
<code>tol</code>	The tolerance.

**Value**

A `track_xyt`.

---

<code>track_resample</code>	<i>Resample track</i>
-----------------------------	-----------------------

---

**Description**

Function to resample a track at a predefined sampling rate within some tolerance.

**Usage**

```
track_resample(x, ...)

## S3 method for class 'track_xyt'
track_resample(x, rate = hours(2), tolerance = minutes(15), start = 1, ...)
```

**Arguments**

x	A track_xyt.
...	Further arguments, none implemented.
rate	A lubridate Period, that indicates the sampling rate.
tolerance	A lubridate Period, that indicates the tolerance of deviations of the sampling rate.
start	A integer scalar, that gives the relocation at which the sampling rate starts.

**Value**

A resampled track\_xyt.

---

transform_coords	<i>Transform CRS</i>
------------------	----------------------

---

**Description**

Transforms the CRS for a track.

**Usage**

```
transform_coords(x, ...)

## S3 method for class 'track_xy'
transform_coords(x, crs_to, crs_from, ...)

transform_crs(x, ...)
```

**Arguments**

x	[track_xy, track_xyt] A track created with make_track.
...	Further arguments, none implemented.
crs_to	[crs(1)] Coordinate reference system the data should be transformed to, see sf::st_crs.
crs_from	[crs(1)] Coordinate reference system the data are currently in, see sf::sf_crs. If crs_from is missing, the crs-attribute of the track is used.

**Value**

A track with transformed coordinates.

**See Also**

sf::st\_transform

**Examples**

```
data(deer)
get_crs(deer)

# project to geographical coordinates (note the CRS is taken automatically from the object deer).
d1 <- transform_coords(deer, crs_to = 4326)
```

---

trast	<i>Create a template raster layer</i>
-------	---------------------------------------

---

**Description**

For some home-range estimation methods (e.g., KDE) a template raster is needed. This functions helps to quickly create such a template raster.

**Usage**

```
make_trast(x, ...)

## S3 method for class 'track_xy'
make_trast(x, factor = 1.5, res = max(c(extent_max(x)/100, 1e-09)), ...)
```

**Arguments**

x	[track_xy, track_xyt] A track created with make_track.
...	Further arguments, none implemented.
factor	[numeric(1)=1.5]{>= 1} Factor by which the extent of the relocations is extended.
res	[numeric(1)] Resolution of the output raster.

**Value**

A RasterLayer without values.

---

update_distr_man	<i>Manually update amt_distr</i>
------------------	----------------------------------

---

## Description

Functions to update amt\_distr from iSSF coefficients

## Usage

```
update_gamma(dist, beta_sl, beta_log_sl)
```

```
update_exp(dist, beta_sl)
```

```
update_hnorm(dist, beta_sl_sq)
```

```
update_lnorm(dist, beta_log_sl, beta_log_sl_sq)
```

```
update_vonmises(dist, beta_cos_ta)
```

## Arguments

dist	[amt_distr] The tentative distribution to be updated respective distributions.
beta_sl	[numeric] The estimate of the coefficient of the step length.
beta_log_sl	[numeric] The estimate of the coefficient of the log of the step length.
beta_sl_sq	[character] The name of the coefficient of the square of the step length.
beta_log_sl_sq	[character] The name of the coefficient of the square of log of the step length.
beta_cos_ta	[numeric] The estimate of the coefficient of cosine of the turning angle.

## Details

These functions are called internally by [update\\_sl\\_distr\(\)](#) and [update\\_ta\\_distr\(\)](#). However, those simple functions assume that the selection-free step-length and turn-angle distributions are constant (i.e., they do not depend on covariates). In the case of interactions between movement parameters and covariates, the user will want to manually access these functions to update their selection-free movement distributions.

## Value

A distribution

**Examples**

```

# Fit an SSF, then update movement parameters.

#Prepare data for SSF
ssf_data <- deer %>%
  steps_by_burst() %>%
  random_steps(n = 15) %>%
  extract_covariates(sh_forest) %>%
  mutate(forest = factor(sh.forest, levels = 1:2,
                        labels = c("forest", "non-forest")),
         cos_ta_ = cos(ta_),
         log_sl_ = log(sl_))

# Check tentative distributions
# Step length
attr(ssf_data, "sl_")
# Turning angle
attr(ssf_data, "ta_")

# Fit an iSSF (note model = TRUE necessary for predict() to work)
m1 <- ssf_data %>%
  fit_issf(case_ ~ forest * (sl_ + log_sl_ + cos_ta_) +
          strata(step_id_), model = TRUE)

# Update forest step lengths (the reference level)
forest_sl <- update_gamma(m1$sl_,
                          beta_sl = m1$model$coefficients["sl_"],
                          beta_log_sl = m1$model$coefficients["log_sl_"])

# Update non-forest step lengths
nonforest_sl <- update_gamma(m1$sl_,
                             beta_sl = m1$model$coefficients["sl_"] +
                               m1$model$coefficients["forestnon-forest:sl_"],
                             beta_log_sl = m1$model$coefficients["log_sl_"] +
                               m1$model$coefficients["forestnon-forest:log_sl_"])

# Update forest turn angles (the reference level)
forest_ta <- update_vonmises(m1$ta_,
                             beta_cos_ta = m1$model$coefficients["cos_ta_"])

# Update non-forest turn angles
nonforest_ta <- update_vonmises(m1$ta_,
                                beta_cos_ta = m1$model$coefficients["cos_ta_"] +
                                m1$model$coefficients["forestnon-forest:cos_ta_"])

```

**Description**

Update tentative step length or turning angle distribution from a fitted iSSF.

**Usage**

```
update_sl_distr(
  object,
  beta_sl = "sl_",
  beta_log_sl = "log_sl_",
  beta_sl_sq = "sl_sq_",
  beta_log_sl_sq = "log_sl_sq_",
  ...
)

update_ta_distr(object, beta_cos_ta = "cos_ta_", ...)
```

**Arguments**

object	[fit_clogit] A fitted iSSF model.
beta_sl	[character] The name of the coefficient of the step length.
beta_log_sl	[character] The name of the coefficient of the log of the step length.
beta_sl_sq	[character] The name of the coefficient of the square of the step length.
beta_log_sl_sq	[character] The name of the coefficient of the square of log of the step length.
...	Further arguments, none implemented.
beta_cos_ta	[character] The name of the coefficient of cosine of the turning angle.

**Value**

An `amt_distr` object, which consists of a list with the name of the distribution and its parameters (saved in `params`).

Wrapper to fit a distribution to data `fit_distr()`

**Examples**

```

# Fit an SSF, then update movement parameters.

# Prepare data for SSF
ssf_data <- deer %>%
  steps_by_burst() %>%
  random_steps(n = 15) %>%
  extract_covariates(sh_forest) %>%
  mutate(forest = factor(sh_forest, levels = 1:2,
                        labels = c("forest", "non-forest")),
         cos_ta_ = cos(ta_),
         log_sl_ = log(sl_))

# Check tentative distributions
# Step length
sl_distr_params(ssf_data)
attr(ssf_data, "sl_")
# Turning angle
ta_distr_params(ssf_data)

# Fit an iSSF
m1 <- ssf_data %>%
  fit_issf(case_ ~ forest +
          sl_ + log_sl_ + cos_ta_ +
          strata(step_id_))

# Update step length distribution
new_gamma <- update_sl_distr(m1)

# Update turning angle distribution
new_vm <- update_ta_distr(m1)

# It is also possible to use different step length distributions

# exponential step-length distribution
s2 <- deer %>% steps_by_burst() %>%
  random_steps(sl_distr = fit_distr(.$sl_, "exp"))
m2 <- s2 %>%
  fit_clogit(case_ ~ sl_ + strata(step_id_))
update_sl_distr(m2)

# half normal step-length distribution
s3 <- deer %>% steps_by_burst() %>%
  random_steps(sl_distr = fit_distr(.$sl_, "hnorm"))
m3 <- s3 %>%
  mutate(sl_sq_ = sl_^2) %>%
  fit_clogit(case_ ~ sl_sq_ + strata(step_id_))
update_sl_distr(m3)

# log normal step-length distribution
s4 <- deer %>% steps_by_burst() %>%

```

```
    random_steps(sl_distr = fit_distr(.$sl_, "lnorm"))
m4 <- s4 %>%
  mutate(log_sl_ = log(sl_), log_sl_sq_ = log(sl_)^2) %>%
  fit_clogit(case_ ~ log_sl_ + log_sl_sq_ + strata(step_id_))
update_sl_distr(m4)
```
