Type Package

Title Bivariate Correlated Frailty Models with Varied Variances

Version 0.1.0

Description Fit and simulate bivariate correlated frailty models with proportional hazard structure. Frailty distributions, such as gamma and lognormal models are supported. Frailty variances of the two subjects can be varied or equal. Details on the models are available in book of Wienke (2011,ISBN:978-1-4200-7388-

1). Bivariate gamma fit is obtained using the approach given in Iachine (1995) with modifications. Lognormal fit is based on the approach by Ripatti and Palmgren (2000) <doi:10.1111/j.0006-341X.2000.01016.x>. Univariate and bivariate shared gamma frailty model fits are possible. Standard errors of the estimated covariate coefficients and frailty variance parameter are obtained using the approach given in Klein and Moeschberger (2003,ISBN:0-387-95399-X).

bcfraildv	<i>Bivariate correlated frailty model with Proportional hazard structure when frailty variances of the two subjects are allowed to be different.</i>
------------------	--

Description

Fit a semiparametric Bivariate correlated frailty models with Proportional Hazard structure where frailty/random effect variances of the two subject are allowed to be varied.

Usage

```
bcfraildv(
  formula,
  data,
  frail_distrn = c("gamma", "lognormal"),
  initfrailp = NULL,
  control = bcfraildv.control(),
  ...
)
```

Arguments

formula	A formula object, with the response on the left of a ~ operator, and the terms on the right. The response must be a survival object as returned by the Surv function.
data	A dataframe contain survival time, censor, covariate etc with data in columns.
frail_distrn	A type of frailty distribution to be used in fit. Either gamma or lognormal. The default is gamma.
initfrailp	Initial estimates for the frailty parameters. The default is c(0.5,0.5,0.5).
control	Arguments to control the fit. The default is bcfraildv.control .
...	further arguments

Value

An object of that contains the following components.

- **coefficients** - A vector of estimated Covariate coefficients.
- **frailparest** - A vector of estimated Frailty/random effect parameters i.e. frailty variances and correlation.
- **vcov**- Variance Covariance matrix of the Estimated Covariate coefficients obtained from the observed information matrix.
- **vcovth**-Variance Covariance matrix of the Estimated Frailty/random effect parameters obtained from the observed information matrix.
- **stderr**-A vector containing the Standard errors of the Estimated parameters both covariate coefficients and frailty parameters.
- **loglik0**- Log likelihood of without frailty model.
- **loglik**-Log likelihood of Cox PH model with frailty.
- **Iloglik**- Log likelihood obtained after integrating out the frailty term in gamma fit.
- **cbashaz**- array containing Cummulative baseline hazard.
- **X**-Matrix of observed covariates.
- **time**-the observed survival time.
- **censor**-censoring indicator.
- **resid**-the martingale residuals.
- **lin.prid**-the vector of linear predictors.
- **frail**-estimated Frailty values.
- **iteration**-Number of outer iterations.
- **e.time**-the vector of unique event times.
- **n.event**- the number of events at each of the unique event times.
- **converg**- TRUE if converge, FALSE otherwise.

Note

Parameters of Bivariate correlated gamma frailty model was estimated using EM approach. The EM approach used here is basically simmilar to the EM-approach proposed by Iachine, I. A. (1995)with modifications. In the proposed EM approach, the expectation part is modified and in maximization part, frailty parameters are estimated from the marginal log likelihood function. Standard errors of the estimated covariate coefficients and the frailty parameters are obtained from the second derivatives of the marginal log likelihood function.

Parameters of Bivariate correlated lognormal frailty model was estimated in similar manner as the penalized likelihood approach used by Ripatti and Palmgren (2000).

```

bcfraildv.control *Arguments for controlling bcfraildv fits.*

Description

This is used to set various numeric parameters controlling a bcfraildv model fit as a single list.

Usage

```

bcfraildv.control(
  max.iter = 5000,
  max.iter2 = 350,
  tol = 1e-06,
  toll = 1e-05,
  lower = c(0, 0, 0),
  upper = c(Inf, Inf, 1),
  fastfit = TRUE,
  obt.se = TRUE,
  fscale = 1,
  print.level = 0,
  ndigit = 12,
  steptol = 1e-06,
  iterlim = 100,
  gradtol = 1e-08,
  check.analyticals = FALSE,
  nlmnb_control = list()
)

```

Arguments

max. iter	Maximum number of iterations allowed in gamma frailty fit. The default is 5000.
max. iter2	Maximum number of iterations allowed in lognormal frailty fit. The default is 350.
tol	A tolerance for convergence in gamma frailty fit i.e the maximum absolute differences between successive iterations. The default is 1e-06.
toll	tolerance for convergence in lognormal frailty fit. The default is 1e-05.
lower	vectors of lower bounds of the frailty parameters.
upper	vectors of upper bounds of the frailty parameters.
fastfit	if true, an algorithm that make lognormal frailty fit more faster will be used. We suggest to leave it as it is.
obt. se	Logical. If TRUE, for gamma fit, standard errors will be obtained using the proposed method else observed information matrix will be used.. We suggest to leave it as it is.
fscale	argument used to control <code>nlm</code> fits used.
print.level	argument used to control <code>nlm</code> fits used.
ndigit	argument used to control <code>nlm</code> fits used.
steptol	argument used to control <code>nlm</code> fits used.
iterlim	argument used to control <code>nlm</code> fits used.
gradtol	argument used to control <code>nlm</code> fits used.
check.analyticals	arguments used to control <code>nlm</code> fits used.
nlminb_control	Arguments used to control <code>nlminb</code> fits used.

Value

The above control parameters in a list.

bcgfrailev

Bivariate correlated gamma frailty modeling with Proportional hazard.

Description

Fit a semiparametric Bivariate correlated gamma frailty model with Proportional Hazard structure.

Usage

```
bcgfrailev(formula, data, initfrailp = NULL, control, ...)
```

Arguments

<code>formula</code>	A formula object, with the response on the left of a ~ operator, and the terms on the right. The response must be a survival object as returned by the Surv function.
<code>data</code>	A dataframe contain survival time, censor, covariate etc with data in columns.
<code>initfrailp</code>	Initial estimates for the frailty parameters. The default is c(0.5,0.5).
<code>control</code>	Arguments to control the fit. The default is <code>bcfraftph.control</code> .
<code>...</code>	further arguments

Value

An object of that contains the following components.

- `coefficients` - A vector of estimated Covariate coefficients.
- `frailparest` - A vector of estimated Frailty parameters i.e. frailty variance and correlation.
- `vcov2`- Variance Covariance matrix of the Estimated Covariate coefficients obtained from the observed information matrix.
- `vcovth2`-Variance Covariance matrix of the Estimated Frailty parameters obtained from the observed information matrix of the marginal likelihood.
- `stderr`-A vector containing the Standard error of the Estimated parameters both covariate coefficients and frailty parameters.
- `loglik0`- Log likelihood of without frailty model.
- `loglik`-Log likelihood of Cox PH model with frailty.
- `Iloglik`- Log likelihood of with frailty model after integrating out the frailty term.
- `cbashaz`- array containing Cummulative baseline hazard.
- `X`-Matrix of observed covariates.
- `time`-the observed survival time.
- `censor`-censoring indicator.
- `resid`-the martingale residuals.
- `lin.prid`-the vector of linear predictors.
- `frail`-estimated Frailty values.
- `iteration`-Number of outer iterations.
- `e.time`-the vector of unique event times.
- `n.event`- the number of events at each of the unique event times.
- `converg`- TRUE if converge, FALSE otherwise.

Note

Parameters of Bivariate correlated gamma frailty model was estimated basically using the EM-approach proposed by Iachine, I. A. (1995) with modifications. The main modification that made on the original EM-approach was similar to the modification made on EM approach for univariate gamma frailty model by Duchateau and Janssen (2008). This means following more or less similar procedure as Duchateau and Janssen (2008), frailty parameters are estimated from the marginal log likelihood function. The results of both EM- approach and the modified EM- approach are similar. The difference is that the modified one is much faster. The standard error of the estimated covariate coefficients and frailty parameters are based on the inverse of the observed information matrix constructed by taking partial derivatives of minus the observable likelihood (the Log likelihood obtained after integrating out the frailty term).

```

Description

Fit Cox PH model with univariate and bivariate shared gamma frailty model.

Usage

```
coxphgmfr(formula, data, initfrailp = NULL, control = bcfraildv.control(), ...)
```

Arguments

<code>formula</code>	A formula object, with the response on the left of a ~ operator, and the terms on the right. The response must be a survival object as returned by the Surv function.
<code>data</code>	A dataframe contain survival time, censor, covariate etc with data in columns.
<code>initfrailp</code>	Initial estimates for the frailty parameters. The default is c(0.5).
<code>control</code>	Arguments to control the fit. The default is <code>bcfraildv.control</code> .
...	further arguments

Value

An object of that contains the following components.

- `coefficients` - A vector of estimated Covariate coefficients.
- `frailparest` - A vector of estimated Frailty parameters i.e. frailty variance and correlation.
- `vcov`- Variance Covariance matrix of the Estimated Covariate coefficients obtained from the observed information matrix.
- `vcov2`-Variance Covariance matrix of the Estimated Frailty parameters obtained from the observed information matrix of the marginal likelihood.
- `stderr`-A vector containing the Standard error of the Estimated parameters both covariate coefficients and frailty parameter.
- `loglik0`- Log likelihood of without frailty model.
- `loglik`-Log likelihood of Cox PH model with frailty.
- `Iloglik`- Log likelihood of with frailty model after integrating out the frailty term.
- `cbashaz`- array containing Cummulative baseline hazard.
- `X`-Matrix of observed covariates.
- `time`-the observed survival time.
- `censor`-censoring indicator.
- `resid`-the martingale residuals.
- `lin.prid`-the vector of linear predictors.
- `frail`-estimated Frailty values.
- `iteration`-Number of outer iterations.
- `e.time`-the vector of unique event times.
- `n.event`- the number of events at each of the unique event times.
- `converg`- TRUE if converge, FALSE otherwise.

Note

This is just a [coxph](#) model with gamma frailty and the differences between [coxph](#) with gamma frailty fit and [coxphgmfr](#) fit is on the standard errors of the covariates coefficients. Here, the standard errors of the estimated covariate coefficients and the frailty variance parameter are obtained using the standard errors estimation approach given in Klein and Moeschberger (2003).

`simbcfraildv`

Simulate data from bivariate correlated frailty models.

Description

Simulate data from bivariate correlated gamma and log-normal frailty models with observed covariates. It allows inclusion of one or two covariates. In addition, frailty variances of the two artificial subjects can be equal or different.

Usage

```
simbcfraildv(
  p.size,
  c.rate = c(0),
  fraildistrn,
  frail.par = c(0.5, 0.5, 0.25),
  bhaz.arg = list(distrn = c("weibull"), shape = c(2.5), scale = c(0.01), rate =
    c(0.5)),
  covar.arg = list(coefs = c(0.5, 0), types = c("BU", "BB", "UU", "B", "U"), size =
    c(1, 1), prob = c(0.5, 0.6), min = c(0, 0), max = c(1, 3))
)
```

Arguments

<code>p.size</code>	pair size.
<code>c.rate</code>	censored rate. The default is zero..
<code>fraildistrn</code>	A type of frailty distribution to be used. Either gamma or log-normal.
<code>frail.par</code>	vector of frailty parameters, variance and correlation respectively. The default is <code>c(0.5,0.5,0.25)</code> meaning frailty variance of subject1 is 0.5, frailty variance of subject2 is 0.5, and correlation 0.25.
<code>bhaz.arg</code>	is a <code>list</code> i.e, <code>list(distrn = c("weibull"),shape =c(2.5),scale = c(0.01),rate = c(0.5))</code> . <code>distrn</code> is the type of baseline hazard to be used. weibull, gompertz and exponential is possible. <code>shape</code> , <code>scale</code> and <code>rate</code> are the parameters of the corresponding baseline hazard parameters. <code>rate</code> needs to be specified if the baseline is exponential.
<code>covar.arg</code>	is a <code>list</code> i.e, <code>coefs</code> is covariate coefficients, <code>types</code> is the type of covariate to be used. One of the following can be specified <code>c("BU", "BB", "UU", "B", "U")</code> . Use "BU" if one binomial and one uniform covariates are desired."BB" is for two binomial covariates. "B" is for binomial and "U" is for uniform. <code>size</code> and <code>prob</code> needs to be specified if binomial covariate(s) are used and if uniform covariate(s) are used, then <code>min</code> and <code>max</code> should be specified.

Value

An object of class `simbcfraildv` that contain the following:

- `data` A data frame i.e, the simulated data set. `IID` is individual Id, `PID` is pair ID, `time` is the simulated survival time, `censor` is censoring indicator and `X1` or `X2` denote the simulated covariate.
- `numberofpair` The specified number of pairs.
- `censoredrate` The specified censored rate.
- `fraildist` The specified frailty distribution.
- `frailpar` The specified frailty parameters.

```

summary.bcfraildv *Print bcfraildv*

Description

Generics to print the S3 class bcfraildv.

Usage

```
## S3 method for class 'bcfraildv'
summary(object, ...)
```

Arguments

object	A class bcfraildv object.
...	ignored

Details

Calls `summary.bcfraildv()`.

Value

An object of `print.bcfraildv`, with some more human-readable results from `bcfraildv` object.

Note

The summary function is currently identical to the print function.

Examples

```
set.seed(24)
simdata<-simbcfraildv(p.size=300, c.rate= c(0.3),fraildistrn=c("gamma"),frail.par=c(0.5,0.5,0.5),
bhaz.arg=list(distrn = c("weibull"),shape =c(5), scale = c(0.1)),
covar.arg=list(coefs=c(2),types = c("B"),size=c(1),prob=c(0.5)))
dataa<-simdata$data

fitbcfraildv=bcfraildv(Surv(time,censor)~ X1+frailty(PID) ,data=dataa,frail_distrn=c("gamma"))
fitbcfraildv
summary(fitbcfraildv)
names(fitbcfraildv)
```

summary.bcgfrailev *Print bcgfrailev*

Description

Generics to print the S3 class bcgfrailev.

Usage

```
## S3 method for class 'bcgfrailev'
summary(object, ...)
```

Arguments

object	A class bcgfrailev object.
...	ignored

Details

Calls `summary.bcgfrailev()`.

Examples

```
set.seed(24)
simdata<-simbcfrailph(p.size=300, c.rate= c(0.3),fraildistrn=c("gamma"),frail.par=c(0.5,0.5),
bhaz.arg=list(distrn = c("weibull"),shape =c(5), scale = c(0.1)),
covar.arg=list(coefs=c(2),types = c("B"),size=c(1),prob=c(0.5)))
dataaa<-simdata$data

fitbcgfrailev=bcgfrailev(Surv(time,censor)~ X1+frailty(PID) ,data=dataaa)
fitbcgfrailev
summary(fitbcgfrailev)
```

summary.coxphgmfr *Print coxphgmfr*

Description

Generics to print the S3 class coxphgmfr.

Usage

```
## S3 method for class 'coxphgmfr'
summary(object, ...)
```

Arguments

object	A class coxphgmfr object.
...	ignored

Details

Calls `summary.coxphgmfr()`.

Value

An object of `summary.coxphgmfr`, with some more human-readable results from `coxphgmfr` object.

Note

The summary function is currently identical to the print function.
