

Package ‘ctmcd’

May 26, 2022

Type Package

Title Estimating the Parameters of a Continuous-Time Markov Chain from Discrete-Time Data

Version 1.4.2

Date 2022-05-25

Author Marius Pfeuffer [aut,cre], Greig Smith [ctb], Goncalo dos Reis [ctb], Linda Moestel [ctb], Matthias Fischer [ctb]

Maintainer Marius Pfeuffer <marius.pfeuffer@fau.de>

Description Functions for estimating Markov generator matrices from discrete-time observations. The implemented approaches comprise diagonal adjustment, weighted adjustment and quasi-optimization of matrix logarithm based candidate solutions, an expectation-maximization algorithm as well as a Gibbs sampler.

ctmcd-package

Estimating the Parameters of a Continuous-Time Markov Chain from Discrete-Time Data

Description

Functions for estimating Markov generator matrices from discrete-time observations.

Author(s)

Examples

```
## Not run:
data(tm_abs)

## Maximum Likelihood Generator Matrix Estimate
gm0=matrix(1,8,8)
diag(gm0)=0
diag(gm0)=-rowSums(gm0)
gm0[8,]=0

gmem=gm(tm_abs, te=1, method="EM", gmguess=gm0)
plot(gmem)

## Confidence Interval
ciem=gmci(gmem, alpha=0.05)
plot(ciem)

## End(Not run)
```

ctmcdlogLik

Discrete-Time Data Log-Likelihood Function

Description

Function for evaluating the likelihood function of a continuous-time Markov chain given discrete-time data.

Usage

```
ctmcdlogLik(gm, tmabs, te)
```

Arguments

| | |
|-------|--|
| gm | generator matrix of continuous-time Markov chain |
| tmabs | matrix of absolute transition frequencies |
| te | time elapsed in transition process |

Author(s)

Marius Pfeuffer

Examples

```
data(tm_abs)

## Initial guess for generator matrix (absorbing default state)
gm0=matrix(1,8,8)
diag(gm0)=0
```

```

diag(gm0)=-rowSums(gm0)
gm0[8,]=0

## Log-likelihood of initial guess
ctmcldlogLik(gm0,tm_abs,1)

```

gm

Generator Matrix Estimation

Description

Generic function to estimate the parameters of a continuous Markov chain

Usage

```
gm(tm, te, method, ...)
```

Arguments

| | |
|--------|---|
| tm | matrix of either absolute transition frequencies (if method is "EM" or "GS") or relative transition frequencies (if method is "DA", "WA" or "QO") |
| te | time elapsed in transition process |
| method | method to derive generator matrix: "DA" - Diagonal Adjustment, "WA" - Weighted Adjustment, "QO" - Quasi-Optimization, "EM" - Expectation-Maximization Algorithm, "GS" - Gibbs Sampler |
| ... | Additional Arguments: <ul style="list-style-type: none"> • gmguess: initial guess for generator matrix estimation procedure (if method is "EM") • prior: prior parametrization (if method is "GS") • burnin: burn-in period (if method is "GS") • eps: convergence criterion (if method is "EM") • conv_pvalue,conv_freq: convergence criterion (if method is "GS") • niter: maximum number of iterations (if method is "EM" or "GS") • sampl_func: optional self-written path sampling function for endpoint-conditioned Markov processes (if method is "GS") • combmat: matrix stating combined use of modified rejection sampling / uniformization sampling algorithms (if method is "GS") • sampl_method: sampling method for deriving endpoint-conditioned Markov process path: "Unif" - Uniformization Sampling, "ModRej" - Modified Rejection Sampling (if method is "GS") • logmethod: method to compute matrix logarithm (if method is "DA", "WA" or "QO", see ?logm from expm package for more information) • expmethod: method to compute matrix exponential (if method is "EM" or "GS", see ?expm from expm package for more information) • verbose: verbose mode (if method is "EM" or "GS") |

Details

The methods "DA", "WA" and "QO" provide adjustments of a matrix logarithm based candidate solution, "EM" gives the maximum likelihood estimate and "GS" a posterior mean estimate in a Bayesian setting with conjugate Gamma priors.

diag(gm0)=0
diag(gm0)=-rowSums(gm0)
gm0[8,]=0

gmem=gm(tm_abs, te=1, method="EM", gmguess=gm0)
gmem

## Quasi Optimization Estimate
tm_rel=rbind((tm_abs/rowSums(tm_abs))[1:7,],c(rep(0,7),1))

gmqo=gm(tm_rel, te=1, method="QO")
gmqo
```

gm.default*Generator Matrix Estimation***Description**

Default function to estimate the parameters of a continuous Markov chain

Usage

```
## Default S3 method:
gm(tm, te, method, gmguess = NULL, prior = NULL, burnin = NULL,
eps = 1e-06, conv_pvalue = 0.05, conv_freq = 10, niter = 10000, sampl_func = NULL,
compmat = NULL, sampl_method = "Unif", logmethod = "Eigen", expmethod = "PadeRBS",
verbose = FALSE, ...)
```

Arguments

| | |
|---------------------|---|
| tm | matrix of either absolute transition frequencies (if method is "EM" or "GS") or relative transition frequencies (if method is "DA", "WA" or "QO") |
| te | time elapsed in transition process |
| method | method to derive generator matrix: "DA" - Diagonal Adjustment, "WA" - Weighted Adjustment, "QO" - Quasi-Optimization, "EM" - Expectation-Maximization Algorithm, "GS" - Gibbs Sampler |
| gmguess | initial guess for generator matrix estimation procedure (if method is "EM") |
| prior | prior parametrization (if method is "GS") |
| burnin | burn-in period (if method is "GS") |
| eps | convergence criterion (if method is "EM" or "GS") |
| conv_pvalue | convergence criterion: stop, if Heidelberger and Welch's diagnostic assumes convergence (see coda package) |
| conv_freq | convergence criterion: absolute frequency of convergence evaluations |
| niter | maximum number of iterations (if method is "EM" or "GS") |
| sampl_func | optional self-written path sampling function for endpoint-conditioned Markov processes (if method is "GS") |
| compmat | matrix stating combined use of modified rejection sampling / uniformization sampling algorithms (if method is "GS") |
| sampl_method | sampling method for deriving endpoint-conditioned Markov process path: "Unif" - Uniformization Sampling, "ModRej" - Modified Rejection Sampling (if method is "GS") |
| logmethod | method to compute matrix logarithm (if method is "DA", "WA" or "QO", see ?logm from expm package for more information) |
| expmethod | method to compute matrix exponential (if method is "EM" or "GS", see ?expm from expm package for more information) |
| verbose | verbose mode (if method is "EM" or "GS") |
| ... | additional arguments |

Details

The methods "DA", "WA" and "QO" provide adjustments of a matrix logarithm based candidate solution, "EM" gives the maximum likelihood estimate and "GS" a posterior mean estimate in a Bayesian setting with conjugate Gamma priors.

gmci*Confidence / Credibility Intervals for Generator Matrix Objects***Description**

Generic function to derive confidence / credibility intervals for "EM" or "GS" based generator matrix objects

Usage

```
gmci(gm, alpha, ...)
```

Arguments

| | |
|--------------------|--|
| <code>gm</code> | a "EM" or "GS" generator matrix object |
| <code>alpha</code> | significance level |
| <code>...</code> | additional arguments: |
| | <ul style="list-style-type: none"> • <code>eps</code>: threshold for which generator matrix parameters are assumed to be fixed at zero (if "EM" object) • <code>cimethod</code>: "Direct" and "SdR" use analytical expressions of the Fisher information matrix, "BS" employs the numerical approach of Bladt and Soerensen, 2009 (if "EM" object) • <code>expmethod</code>: method to compute matrix exponentials (see <code>?expm</code> from <code>expm</code> package for more information) |

Details

If `gm` is based on the "EM" method (expectation-maximization algorithm), the function computes a Wald confidence interval based on the method of Oakes, 1999. If `gm` is based on the "GS" method (Gibbs sampler), the function computes an equal-tailed credibility interval.

```

Description

Function for deriving a Markov generator matrix estimate based on the diagonal adjustment method of Israel et al., 2001

Usage

```
gmDA(tmrel, te, logmethod = "Eigen")
```

Arguments

| | |
|-----------|--|
| tmrel | matrix of relative transition frequencies |
| te | time elapsed in transition process |
| logmethod | method for computation of matrix logarithm, by default eigendecomposition is chosen (see ?logm from expm package for more information) |

Details

A candidate solution is derived by the matrix logarithm and then adjusted in order to fulfil the properties of a Markov generator matrix.

Examples

```
## Derive matrix of relative transition frequencies
data(tm_abs)
tm_rel=rbind((tm_abs/rowSums(tm_abs))[1:7,],c(rep(0,7),1))

## Derive diagonal adjustment generator matrix estimate
gmda=gmDA(tm_rel,1)
gmda
```

Description

Function for deriving a Markov generator matrix estimate by an instance of the expectation-maximization algorithm (described by Bladt and Soerensen, 2005)

Usage

```
gmEM(tmabs, te, gmguess, eps = 1e-06, niter = 10000, expmethod = "PadeRBS",
verbose = FALSE)
```

Arguments

| | |
|------------------------|--|
| <code>tmabs</code> | matrix of absolute transition frequencies |
| <code>te</code> | time elapsed in transition process |
| <code>gmguess</code> | initial guess (for generator matrix) |
| <code>eps</code> | stop criterion: stop, if relative change in log-likelihood is smaller than <code>eps</code> |
| <code>niter</code> | stop criterion: maximum number of iterations |
| <code>expmethod</code> | method for computation of matrix exponential, by default "PadeRBS" is chosen (see <code>?expm</code> from <code>expm</code> package for more information) |
| <code>verbose</code> | verbose mode |

Details

A maximum likelihood generator matrix estimate is derived by an instance of the expectation-maximization algorithm.

Examples

```
data(tm_abs)

## Initial guess for generator matrix (absorbing default state)
gm0=matrix(1,8,8)
diag(gm0)=0
diag(gm0)=-rowSums(gm0)
gm0[8,]=0

## Derive expectation-maximization algorithm generator matrix estimate
gmem=gmEM(tmabs=tm_abs,1,gmguess=gm0,verbose=TRUE)
gmem
```

Description

Function for deriving a Markov generator matrix estimate by Gibbs sampling (described by Bladt and Soerensen, 2005)

Usage

```
gmGS(tmabs, te, prior, burnin, conv_pvalue = 0, conv_freq = 10,
niter = 10000, sampl_method = "Unif", expmethod = "PadeRBS", verbose = FALSE,
compmat=NULL, sampl_func = NULL)
```

Arguments

| | |
|---------------------------|---|
| <code>tmabs</code> | matrix of absolute transition frequencies |
| <code>te</code> | time elapsed in transition process |
| <code>prior</code> | list of prior parameters (Gamma prior) |
| <code>burnin</code> | number of burn-in iterations |
| <code>conv_pvalue</code> | convergence criterion: stop, if Heidelberger and Welch's diagnostic assumes convergence (see coda package), convergence check is only employed if <code>conv_pvalue</code> >0 |
| <code>conv_freq</code> | convergence criterion: absolute frequency of convergence evaluations |
| <code>niter</code> | stop criterion: stop, if maximum number of iterations is exceeded |
| <code>sampl_method</code> | method for sampling paths from endpoint-conditioned Markov processes. options: "Unif" - Uniformization sampling, "ModRej" - Modified Rejection Sampling |
| <code>expmethod</code> | method for computation of matrix exponential, by default "PadeRBS" is chosen (see ?expm from expm package for more information) |
| <code>verbose</code> | verbose mode |
| <code>compmat</code> | matrix specifying the combined use of sampling methods: "U" - uniformization sampling, "M" - modified rejection sampling |
| <code>sampl_func</code> | interface for own endpoint-conditioned Markov process sampling function |

Details

A posterior mean generator matrix estimate is derived by Gibbs Sampling. The gamma distribution is used as prior.

## End(Not run)
```

Description

Function for deriving a Markov generator matrix estimate based on the quasi-optimization procedure of Kreinin and Sidelnikova, 2001

Usage

```
gmQO(tmrel, te, logmethod = "Eigen")
```

Arguments

| | |
|------------------------|--|
| <code>tmrel</code> | matrix of relative transition frequencies |
| <code>te</code> | time elapsed in transition process |
| <code>logmethod</code> | method for computation of matrix logarithm, by default eigendecomposition is chosen (see <code>?logm</code> from <code>expm</code> package for more information) |

Details

From the set of possible Markov generator matrices, the one is chosen which is closest to a matrix logarithm based candidate solution in terms of sum of squared deviations.

gmqo
```

gmWA

Weighted Adjustment

Description

Function for deriving a Markov generator matrix estimate based on the weighted adjustment method of Israel et al., 2001

Usage

```
gmWA(tmrel, te, logmethod = "Eigen")
```

Arguments

| | |
|-----------|--|
| tmrel | matrix of relative transition frequencies |
| te | time elapsed in transition process |
| logmethod | method for computation of matrix logarithm, by default eigendecomposition is chosen (see ?logm from expm package for more information) |

Details

A candidate solution is derived by the matrix logarithm and then adjusted in order to fulfil the properties of a Markov generator matrix.

gmwa=gmWA(tm_rel,1)
gmwa
```

plot.gm

Plot Function for Generator Matrix Estimation Objects

Description

Function for visualizing the output of a generator matrix estimation procedure.

Usage

```
## S3 method for class 'gm'
plot(x, mattext, col = c("grey", "red"), main = x$method, las = 1,
xlab = "To", ylab = "From", xnames, ynames, cex = 1, fig = 3, opacity_factor, ...)
```

Arguments

| | |
|-----------------------|--|
| x | a generator matrix estimation object |
| mattext | optional: matrix of strings replacing the parameter estimates |
| col | two element vector of basis colors for positive and negative parameter estimate entries |
| main | optional: plot title |
| las | orientation of x and y axis elements |
| xlab | x axis name |
| ylab | y axis name |
| xnames | description of x axis elements |
| ynames | description of y axis elements |
| cex | font size |
| fig | number of significant figure to be plotted |
| opacity_factor | two element vector for specification of opacity for positive and negative parameter entry highlighting (must be greater than zero) |
| ... | additional arguments |

|-------|---|
| tmabs | matrix of absolute transition frequencies |
| te | time elapsed in transition process |
| gm | generator matrix |

Details

Function for the simulation of paths from an endpoint-conditioned Markov process. Returns number of transitions NijT and cumulative holding times RiT.

Author(s)

Jon Fintzi, Marius Pfeuffer

References

Examples

```
data(tm_abs)

## Initial guess for generator matrix (absorbing default state)

gm=matrix(1,8,8)
diag(gm)=0
diag(gm)=-rowSums(gm)
gm[8,]=0

rNijTRiT_ModRej(tm_abs,1,gm)
```

rNijTRiT_Unif

C++ Based Uniformization Sampling

Description

Function for generating initial and endpoint-conditioned Markov process sampling paths for a given discrete-time transition matrix

Usage

```
rNijTRiT_Unif(tmabs, te, gm, tpm)
```

Arguments

| | |
|-------|---|
| tmabs | matrix of absolute transition frequencies |
| te | time elapsed in transition process |
| gm | generator matrix |
| tpm | discrete-time transition probability matrix, matrix exponential of gm |

Details

Function for the simulation of paths from an endpoint-conditioned Markov process. Returns number of transitions NijT and cumulative holding times RiT.

Examples

```
data(tm_abs)

## Generator Matrix
gm=matrix(1,8,8)
diag(gm)=0
diag(gm)=-rowSums(gm)
gm[8,]=0

## Transition Probability Matrix
library(expm)
te=1
tpm=expm(gm*te)

rNijTRiT_Unif(tm_abs, te, gm, tpm)
```

summary.gm

Extended Output for Generator Matrix Estimate Objects

Description

Function for providing results and extended output of a generator matrix estimation procedure.

Usage

```
## S3 method for class 'gm'
summary(object, ...)
```

Arguments

| | |
|--------|--------------------------------------|
| object | a generator matrix estimation object |
| ... | additional arguments |

tmci*Delta Method Confidence Intervals for Matrix Exponential Transformations of Generator Matrix Objects*

Description

Generic function to derive delta method based confidence intervals for matrix exponential transformations of "EM" based generator matrix objects

Usage

```
tmci(gmem, alpha, te, eps = 1e-04, expmethod = "PadeRBS")
```

Arguments

| | |
|-----------|--|
| gmem | an "EM" generator matrix object |
| alpha | significance level |
| te | discrete time horizon for which the interval is supposed to be computed |
| eps | threshold for which generator matrix parameters are assumed to be fixed at zero |
| expmethod | method to compute matrix exponentials (see ?expm from expm package for more information) |

Details

Confidence intervals for discrete-time transition matrix predictions given generator matrix estimates are computed by using the delta method for matrix exponential transformations.
