

# Package ‘quanteda.textmodels’

August 29, 2022

**Type** Package

**Title** Scaling Models and Classifiers for Textual Data

**Version** 0.9.5

**Description** Scaling models and classifiers for sparse matrix objects representing textual data in the form of a document-feature matrix. Includes original implementations of 'Laver', 'Benoit', and Garry's (2003) <[doi:10.1017/S0003055403000698](https://doi.org/10.1017/S0003055403000698)>, 'Wordscores' model, Perry and 'Benoit's' (2017) <[arXiv:1710.08963](https://arxiv.org/abs/1710.08963)> class affinity scaling model, and 'Slapin' and 'Proksch's' (2008) <[doi:10.1111/j.1540-5907.2008.00338.x](https://doi.org/10.1111/j.1540-5907.2008.00338.x)> 'wordfish' model, as well as methods for correspondence analysis, latent semantic analysis, and fast Naive Bayes and linear 'SVMs' specially designed for sparse textual data.

**Depends** R (>= 3.1.0), methods

**Imports** glmnet, LiblineaR, Matrix (>= 1.2), quanteda (>= 2.0), RSpectra, Rcpp (>= 0.12.12), RcppParallel, SparseM, stringi

**Suggests** ca, covr, fastNaiveBayes, knitr, lsa, microbenchmark, naivebayes, quanteda.textplots, spelling, testthat, rmarkdown

**LinkingTo** Rcpp, RcppParallel, RcppArmadillo (>= 0.7.600.1.0), quanteda

**URL** <https://github.com/quanteda/quanteda.textmodels>

**License** GPL-3

**Encoding** UTF-8

**LazyData** true

**Language** en-GB

**RoxygenNote** 7.2.1

**SystemRequirements** C++11

**Collate** 'RcppExports.R' 'quanteda.textmodels-package.R'  
'data-documentation.R' 'textmodel-methods.R'  
'textmodel\_affinity.R' 'textmodel\_ca.R' 'textmodel\_lsa.R'  
'textmodel\_lr.R' 'textmodel\_nb.R' 'textmodel\_svm.R'  
'textmodel\_svmlin.R' 'textmodel\_wordfish.R'  
'textmodel\_wordscores.R' 'textplot\_influence.R' 'utils.R'

**VignetteBuilder** knitr

**NeedsCompilation** yes

**Author** Kenneth Benoit [cre, aut, cph]

---

data\_corpus\_dailnoconf1991

*Confidence debate from 1991 Irish Parliament*

---

### Description

Texts of speeches from a no-confidence motion debated in the Irish Dáil from 16-18 October 1991 over the future of the Fianna Fail-Progressive Democrat coalition. (See Laver and Benoit 2002 for details.)

### Usage

data\_corpus\_dailnoconf1991

**Format**

data\_corpus\_dailnoconf1991 is a corpus with 58 texts, including docvars for name, party, and position.

**Source**

<https://www.oireachtas.ie/en/debates/debate/dail/1991-10-16/10/>

**References**

**Examples**

```
## Not run:
library("quanteda")
data_dfm_dailnoconf1991 <- data_corpus_dailnoconf1991 %>%
  tokens(remove_punct = TRUE) %>%
  dfm()
tmod <- textmodel_affinity(data_dfm_dailnoconf1991,
  c("Govt", "Opp", "Opp", rep(NA, 55)))
(pred <- predict(tmod))
dat <-
  data.frame(party = as.character(docvars(data_corpus_dailnoconf1991, "party")),
    govt = coef(pred)[, "Govt"],
    position = as.character(docvars(data_corpus_dailnoconf1991, "position")),
    stringsAsFactors = FALSE)
bymedian <- with(dat, reorder(paste(party, position), govt, median))
par(mar = c(5, 6, 4, 2)+.1)
boxplot(govt ~ bymedian, data = dat,
  horizontal = TRUE, las = 1,
  xlab = "Degree of support for government")
abline(h = 7.5, col = "red", lty = "dashed")
text(c(0.9, 0.9), c(8.5, 6.5), c("Government", "Opposition"))

## End(Not run)
```

---

data\_corpus\_EPcoaldebate

*Crowd-labelled sentence corpus from a 2010 EP debate on coal subsidies*

---

## Description

A multilingual text corpus of speeches from a European Parliament debate on coal subsidies in 2010, with individual crowd codings as the unit of observation. The sentences are drawn from officially translated speeches from a debate over a European Parliament debate concerning a Commission report proposing an extension to a regulation permitting state aid to uncompetitive coal mines.

Each speech is available in six languages: English, German, Greek, Italian, Polish and Spanish. The unit of observation is the individual crowd coding of each natural sentence. For more information on the coding approach see Benoit et al. (2016).

## Usage

data\_corpus\_EPcoaldebate

## Format

The corpus consists of 16,806 documents (i.e. codings of a sentence) and includes the following document-level variables:

**sentence\_id** character; a unique identifier for each sentence

**crowd\_subsidy\_label** factor; whether a coder labelled the sentence as "Pro-Subsidy", "Anti-Subsidy" or "Neutral or inapplicable"

**language** factor; the language (translation) of the speech

**name\_last** character; speaker's last name

**name\_first** character; speaker's first name

**ep\_group** factor; abbreviation of the EP party group of the speaker

**country** factor; the speaker's country of origin

**vote** factor; the speaker's vote on the proposal (For/Against/Abstain/NA)

**coder\_id** character; a unique identifier for each crowd coder

**coder\_trust** numeric; the "trust score" from the Crowdfunder platform used to code the sentences, which can theoretically range between 0 and 1. Only coders with trust scores above 0.8 are included in the corpus.

A [corpus](#) object.

---

data\_corpus\_irishbudget2010

*Irish budget speeches from 2010*

---

**Description**

Speeches and document-level variables from the debate over the Irish budget of 2010.

**Usage**

data\_corpus\_irishbudget2010

**Format**

The corpus object for the 2010 budget speeches, with document-level variables for year, debate, serial number, first and last name of the speaker, and the speaker's party.

**Details**

At the time of the debate, Fianna Fáil (FF) and the Greens formed the government coalition, while Fine Gael (FG), Labour (LAB), and Sinn Féin (SF) were in opposition.

---

data\_corpus\_moviereviews

*Movie reviews with polarity from Pang and Lee (2004)*

---

**Description**

A corpus object containing 2,000 movie reviews classified by positive or negative sentiment.

**Usage**

data\_corpus\_moviereviews

**Format**

The corpus includes the following document variables:

**sentiment** factor indicating whether a review was manually classified as positive pos or negative neg.

**id1** Character counting the position in the corpus.

**id2** Random number for each review.

**Details**

For more information, see `cat(meta(data_corpus_moviereviews, "readme"))`.

**Source**

**References**

Pang, B., Lee, L. (2004) "A Sentimental Education: Sentiment Analysis Using Subjectivity Summarization Based on Minimum Cuts.", Proceedings of the ACL.

**Examples**

```
# check polarities
table(data_corpus_moviereviews$sentiment)

# make the data into sentences, because each line is a sentence
data_corpus_moviereviewsents <-
  quanteda::corpus_segment(data_corpus_moviereviews, "\n", extract_pattern = FALSE)
print(data_corpus_moviereviewsents, max_ndoc = 3)
```

---

textmodel\_affinity      *Class affinity maximum likelihood text scaling model*

---

**Description**

textmodel\_affinity implements the maximum likelihood supervised text scaling method described in Perry and Benoit (2017).

**Usage**

```
textmodel_affinity(
  x,
  y,
  exclude = NULL,
  smooth = 0.5,
  ref_smooth = 0.5,
  verbose = quanteda_options("verbose")
)
```

**Arguments**

x	the <code>dfm</code> or <code>bootstrap_dfm</code> object on which the model will be fit. Does not need to contain only the training documents, since the index of these will be matched automatically.
y	vector of training classes/scores associated with each document identified in data
exclude	a set of words to exclude from the model
smooth	a smoothing parameter for class affinities; defaults to 0.5 (Jeffreys prior). A plausible alternative would be 1.0 (Laplace prior).
ref_smooth	a smoothing parameter for token distributions; defaults to 0.5
verbose	logical; if TRUE print diagnostic information during fitting.

**Author(s)**

Patrick Perry and Kenneth Benoit

**References**

Perry, P.O. & Benoit, K.R. (2017). Scaling Text with the Class Affinity Model. [arXiv:1710.08963 \[stat.ML\]](#).

**See Also**

`predict.textmodel_affinity()` for methods of applying a fitted `textmodel_affinity` model object to predict quantities from (other) documents.

**Examples**

```
(af <- textmodel_affinity(quanteda::data_dfm_lbgexample, y = c("L", NA, NA, NA, "R", NA)))
predict(af)
predict(af, newdata = quanteda::data_dfm_lbgexample[6, ])

## Not run:
# compute bootstrapped SEs
dfmat <- quanteda::bootstrap_dfm(data_corpus_dailnoconf1991, n = 10, remove_punct = TRUE)
textmodel_affinity(dfmat, y = c("Govt", "Opp", "Opp", rep(NA, 55)))

## End(Not run)
```

---

textmodel\_ca

*Correspondence analysis of a document-feature matrix*

---

**Description**

`textmodel_ca` implements correspondence analysis scaling on a `dfm`. The method is a fast/sparse version of function `ca`.

## Usage

```
textmodel_ca(x, smooth = 0, nd = NA, sparse = FALSE, residual_floor = 0.1)
```

## Arguments

x	the dfm on which the model will be fit
smooth	a smoothing parameter for word counts; defaults to zero.
nd	Number of dimensions to be included in output; if NA (the default) then the maximum possible dimensions are included.
sparse	retains the sparsity if set to TRUE; set it to TRUE if x (the <a href="#">dfm</a> ) is too big to be allocated after converting to dense
residual_floor	specifies the threshold for the residual matrix for calculating the truncated svd. Larger value will reduce memory and time cost but might reduce accuracy; only applicable when sparse = TRUE

## Details

[svds](#) in the **RSpectra** package is applied to enable the fast computation of the SVD.

## Value

`textmodel_ca()` returns a fitted CA textmodel that is a special class of **ca** object.

## Note

You may need to set `sparse = TRUE`) and increase the value of `residual_floor` to ignore less important information and hence to reduce the memory cost when you have a very big [dfm](#). If your attempt to fit the model fails due to the matrix being too large, this is probably because of the memory demands of computing the  $V \times V$  residual matrix. To avoid this, consider increasing the value of `residual_floor` by 0.1, until the model can be fit.

library("quanteda")
dfmat <- dfm(tokens(data_corpus_irishbudget2010))
tmod <- textmodel_ca(dfmat)
summary(tmod)
```

---

textmodel\_lr

*Logistic regression classifier for texts*

---

## Description

Fits a fast penalized maximum likelihood estimator to predict discrete categories from sparse `dfm` objects. Using the `glmnet` package, the function computes the regularization path for the lasso or elasticnet penalty at a grid of values for the regularization parameter lambda. This is done automatically by testing on several folds of the data at estimation time.

## Usage

```
textmodel_lr(x, y, ...)
```

## Arguments

x	the <code>dfm</code> on which the model will be fit. Does not need to contain only the training documents.
y	vector of training labels associated with each document identified in train. (These will be converted to factors if not already factors.)
...	additional arguments passed to <code>cv.glmnet()</code>

## References

Friedman, J., Hastie, T., & Tibshirani, R. (2010). Regularization Paths for Generalized Linear Models via Coordinate Descent. *Journal of Statistical Software* 33(1), 1-22. doi:10.18637/jss.v033.i01

## Examples

```
## Example from 13.1 of _An Introduction to Information Retrieval_
library("quanteda")
corp <- corpus(c(d1 = "Chinese Beijing Chinese",
                d2 = "Chinese Chinese Shanghai",
                d3 = "Chinese Macao",
                d4 = "Tokyo Japan Chinese",
                d5 = "London England Chinese",
                d6 = "Chinese Chinese Chinese Tokyo Japan"),
              docvars = data.frame(train = factor(c("Y", "Y", "Y", "N", "N", NA))))
```

```
dfmat <- dfm(tokens(corp), tolower = FALSE)

## simulate bigger sample as classification on small samples is problematic
set.seed(1)
dfmat <- dfm_sample(dfmat, 50, replace = TRUE)

## train model
(tmod1 <- textmodel_lr(dfmat, docvars(dfmat, "train")))
summary(tmod1)
coef(tmod1)

## predict probability and classes
predict(tmod1, type = "prob")
predict(tmod1)
```

---

textmodel\_lsa

*Latent Semantic Analysis*

---

## Description

Fit the Latent Semantic Analysis scaling model to a [dfm](#), which may be weighted (for instance using [quanteda::dfm\\_tfidf\(\)](#)).

## Usage

```
textmodel_lsa(x, nd = 10, margin = c("both", "documents", "features"))
```

## Arguments

x	the <a href="#">dfm</a> on which the model will be fit
nd	the number of dimensions to be included in output
margin	margin to be smoothed by the SVD

## Details

[svds](#) in the **RSpectra** package is applied to enable the fast computation of the SVD.

## Note

The number of dimensions *nd* retained in LSA is an empirical issue. While a reduction in *k* can remove much of the noise, keeping too few dimensions or factors may lose important information.

## Examples

```
library("quantda")
dfmat <- dfm(tokens(data_corpus_irishbudget2010))
# create an LSA space and return its truncated representation in the low-rank space
tmod <- textmodel_lsa(dfmat[1:10, ])
head(tmod$docs)

# matrix in low_rank LSA space
tmod$matrix_low_rank[,1:5]

# fold queries into the space generated by dfmat[1:10,]
# and return its truncated versions of its representation in the new low-rank space
pred <- predict(tmod, newdata = dfmat[11:14, ])
pred$docs_newspace
```

---

textmodel\_nb

*Naive Bayes classifier for texts*

---

## Description

Fit a multinomial or Bernoulli Naive Bayes model, given a dfm and some training labels.

## Usage

```
textmodel_nb(
  x,
  y,
  smooth = 1,
  prior = c("uniform", "docfreq", "termfreq"),
  distribution = c("multinomial", "Bernoulli")
)
```

**Arguments**

x	the <code>dfm</code> on which the model will be fit. Does not need to contain only the training documents.
y	vector of training labels associated with each document identified in <code>train</code> . (These will be converted to factors if not already factors.)
smooth	smoothing parameter for feature counts, added to the feature frequency totals by training class
prior	prior distribution on texts; one of "uniform", "docfreq", or "termfreq". See Prior Distributions below.
distribution	count model for text features, can be multinomial or Bernoulli. To fit a "binary multinomial" model, first convert the <code>dfm</code> to a binary matrix using <code>[quanteda::dfm_weight](x, sc</code>

**Value**

`textmodel_nb()` returns a list consisting of the following (where  $I$  is the total number of documents,  $J$  is the total number of features, and  $k$  is the total number of training classes):

call	original function call
param	$k \times V$ ; class conditional posterior estimates
x	the $N \times V$ training <code>dfm</code> <code>x</code>
y	the $N$ -length <code>y</code> training class vector, where NAs will not be used will be retained in the saved <code>x</code> matrix
distribution	character; the distribution of <code>x</code> for the NB model
priors	numeric; the class prior probabilities
smooth	numeric; the value of the smoothing parameter

**Prior distributions**

Prior distributions refer to the prior probabilities assigned to the training classes, and the choice of prior distribution affects the calculation of the fitted probabilities. The default is uniform priors, which sets the unconditional probability of observing the one class to be the same as observing any other class.

"Document frequency" means that the class priors will be taken from the relative proportions of the class documents used in the training set. This approach is so common that it is assumed in many examples, such as the worked example from Manning, Raghavan, and Schütze (2008) below. It is not the default in **quanteda**, however, since there may be nothing informative in the relative numbers of documents used to train a classifier other than the relative availability of the documents. When training classes are balanced in their number of documents (usually advisable), however, then the empirically computed "docfreq" would be equivalent to "uniform" priors.

Setting `prior` to "termfreq" makes the priors equal to the proportions of total feature counts found in the grouped documents in each training class, so that the classes with the largest number of features are assigned the largest priors. If the total count of features in each training class was the same, then "uniform" and "termfreq" would be the same.

**Smoothing parameter**

The smooth value is added to the feature frequencies, aggregated by training class, to avoid zero frequencies in any class. This has the effect of giving more weight to infrequent term occurrences.

```

---

textmodel\_svm                      *Linear SVM classifier for texts*

---

### Description

Fit a fast linear SVM classifier for texts, using the **LiblineaR** package.

### Usage

```
textmodel_svm(
  x,
  y,
  weight = c("uniform", "docfreq", "termfreq"),
  type = 1,
  ...
)
```

### Arguments

x	the <i>dfm</i> on which the model will be fit. Does not need to contain only the training documents.
y	vector of training labels associated with each document identified in <i>train</i> . (These will be converted to factors if not already factors.)
weight	weights for different classes for imbalanced training sets, passed to <i>wi</i> in <code>LiblineaR::LiblineaR()</code> . "uniform" uses default; "docfreq" weights by the number of training examples, and "termfreq" by the relative sizes of the training classes in terms of their total lengths in tokens.
type	argument passed to the <i>type</i> argument in <code>LiblineaR::LiblineaR()</code> ; default is 1 for L2-regularized L2-loss support vector classification (dual)
...	additional arguments passed to <code>LiblineaR::LiblineaR()</code>

### References

### Examples

```
# use party leaders for govt and opposition classes
library("quantda")
docvars(data_corpus_irishbudget2010, "govtopp") <-
  c(rep(NA, 4), "Gov", "Opp", NA, "Opp", NA, NA, NA, NA, NA)
```

```
dfmat <- dfm(tokens(data_corpus_irishbudget2010))
tmod <- textmodel_svm(dfmat, y = dfmat$govtopp)
predict(tmod)

# multiclass problem - all party leaders
tmod2 <- textmodel_svm(dfmat,
  y = c(rep(NA, 3), "SF", "FF", "FG", NA, "LAB", NA, NA, "Green", rep(NA, 3)))
predict(tmod2)
```

---

textmodel\_wordfish      *Wordfish text model*

---

## Description

Estimate Slapin and Proksch's (2008) "wordfish" Poisson scaling model of one-dimensional document positions using conditional maximum likelihood.

## Usage

```
textmodel_wordfish(
  x,
  dir = c(1, 2),
  priors = c(Inf, Inf, 3, 1),
  tol = c(1e-06, 1e-08),
  dispersion = c("poisson", "quasipoisson"),
  dispersion_level = c("feature", "overall"),
  dispersion_floor = 0,
  sparse = FALSE,
  abs_err = FALSE,
  svd_sparse = TRUE,
  residual_floor = 0.5
)
```

## Arguments

x	the dfm on which the model will be fit
dir	set global identification by specifying the indexes for a pair of documents such that $\hat{\theta}_{dir[1]} < \hat{\theta}_{dir[2]}$ .
priors	prior precisions for the estimated parameters $\alpha_i$ , $\psi_j$ , $\beta_j$ , and $\theta_i$ , where $i$ indexes documents and $j$ indexes features
tol	tolerances for convergence. The first value is a convergence threshold for the log-posterior of the model, the second value is the tolerance in the difference in parameter values from the iterative conditional maximum likelihood (from conditionally estimating document-level, then feature-level parameters).
dispersion	sets whether a quasi-Poisson quasi-likelihood should be used based on a single dispersion parameter ("poisson"), or quasi-Poisson ("quasipoisson")

dispersion_level	sets the unit level for the dispersion parameter, options are "feature" for term-level variances, or "overall" for a single dispersion parameter
dispersion_floor	constraint for the minimal underdispersion multiplier in the quasi-Poisson model. Used to minimize the distorting effect of terms with rare term or document frequencies that appear to be severely underdispersed. Default is 0, but this only applies if dispersion = "quasipoisson".
sparse	specifies whether the "dfm" is coerced to dense. While setting this to TRUE will make it possible to handle larger dfm objects (and make execution faster), it will generate slightly different results each time, because the sparse SVD routine has a stochastic element.
abs_err	specifies how the convergence is considered
svd_sparse	uses svd to initialize the starting values of theta, only applies when sparse = TRUE
residual_floor	specifies the threshold for residual matrix when calculating the svds, only applies when sparse = TRUE

### Details

The returns match those of Will Lowe's R implementation of wordfish (see the austin package), except that here we have renamed words to be features. (This return list may change.) We have also followed the practice begun with Slapin and Proksch's early implementation of the model that used a regularization parameter of  $se(\sigma) = 3$ , through the third element in priors.

### Value

An object of class textmodel\_fitted\_wordfish. This is a list containing:

dir	global identification of the dimension
theta	estimated document positions
alpha	estimated document fixed effects
beta	estimated feature marginal effects
psi	estimated word fixed effects
docs	document labels
features	feature labels
sigma	regularization parameter for betas in Poisson form
ll	log likelihood at convergence
se.theta	standard errors for theta-hats
x	dfm to which the model was fit

### Note

In the rare situation where a warning message of "The algorithm did not converge." shows up, removing some documents may work.

textmodel\_wardscores *Wordscores text model*

---

### Description

textmodel\_wardscores implements Laver, Benoit and Garry's (2003) "Wordscores" method for scaling texts on a single dimension, given a set of anchoring or *reference* texts whose values are set through reference scores. This scale can be fitted in the linear space (as per LBG 2003) or in the logit space (as per Beauchamp 2012). Estimates of *virgin* or unknown texts are obtained using the predict() method to score documents from a fitted textmodel\_wardscores object.

### Usage

```
textmodel_wardscores(x, y, scale = c("linear", "logit"), smooth = 0)
```

### Arguments

x	the <a href="#">dfm</a> on which the model will be trained
y	vector of training scores associated with each document in x
scale	scale on which to score the words; "linear" for classic LBG linear posterior weighted word class differences, or "logit" for log posterior differences
smooth	a smoothing parameter for word counts; defaults to zero to match the LBG (2003) method. See Value below for additional information on the behaviour of this argument.

### Details

The textmodel\_wardscores() function and the associated [predict\(\)](#) method are designed to function in the same manner as [stats::predict.lm\(\)](#). [coef\(\)](#) can also be used to extract the word coefficients from the fitted textmodel\_wardscores object, and [summary\(\)](#) will print a nice summary of the fitted object.

### Value

A fitted textmodel\_wardscores object. This object will contain a copy of the input data, but in its original form without any smoothing applied. Calling [predict.textmodel\\_wardscores\(\)](#) on this object without specifying a value for newdata, for instance, will predict on the unsmoothed object. This behaviour differs from versions of [quanteda](#) <= 1.2.
