

Package ‘saeHB’

April 8, 2022

Type Package

Title Small Area Estimation using Hierarchical Bayesian Method

Version 0.2.1

Author Azka Ubaidillah [aut], Ika Yuni Wulansari [aut], Zaza Yuda Perwira [aut, cre]

Maintainer Zaza Yuda Perwira <221710086@stis.ac.id>

Description Provides several functions for area level of small area estimation using hierarchical Bayesian (HB) method with several univariate distributions for variable of interest. The dataset that used in every function is generated accordingly in the Example. The 'rjags' package is employed to obtain parameter estimates. Model-based estimators involves the HB estimators which include the mean and the variation of mean. For the reference, see Rao and Molina (2015) <[doi:10.1002/9781118735855](https://doi.org/10.1002/9781118735855)>.

Beta	<i>Small Area Estimation using Hierarchical Bayesian under Beta Distribution</i>
------	--

Description

This function is implemented to variable of interest (y) that assumed to be a Beta Distribution. The range of data must be $0 < y < 1$. The data proportion is supposed to be implemented with this function.

Usage

```
Beta(
  formula,
  iter.update = 3,
  iter.mcmc = 10000,
  coef,
  var.coef,
  thin = 3,
  burn.in = 2000,
  tau.u = 1,
  data
)
```

Arguments

<code>formula</code>	Formula that describe the fitted model
<code>iter.update</code>	Number of updates with default 3
<code>iter.mcmc</code>	Number of total iterations per chain with default 10000
<code>coef</code>	a vector contains prior initial value of Coefficient of Regression Model for fixed effect with default vector of 0 with the length of the number of regression coefficients
<code>var.coef</code>	a vector contains prior initial value of variance of Coefficient of Regression Model with default vector of 1 with the length of the number of regression coefficients
<code>thin</code>	Thinning rate, must be a positive integer with default 2
<code>burn.in</code>	Number of iterations to discard at the beginning with default 2000
<code>tau.u</code>	Prior initial value of inverse of Variance of area random effect with default 1
<code>data</code>	The data frame

Value

This function returns a list of the following objects:

<code>Est</code>	A vector with the values of Small Area mean Estimates using Hierarchical bayesian method
<code>refVar</code>	Estimated random effect variances
<code>coefficient</code>	A dataframe with the estimated model coefficient
<code>plot</code>	Trace, Dencity, Autocorrelation Function Plot of MCMC samples

Examples

```
#Data Generation
set.seed(123)
m=30
x1=runif(m,0,1)
x2=runif(m,0,1)
x3=runif(m,0,1)
x4=runif(m,0,1)
b0=b1=b2=b3=b4=0.5
u=rnorm(m,0,1)
pi=rgamma(1,1,0.5)
Mu <- exp(b0+b1*x1+b2*x2+b3*x3+b4*x4+u)/(1+exp(b0+b1*x1+b2*x2+b3*x3+b4*x4+u))
A=Mu*pi
B=(1-Mu) * pi
y=rbeta(m,A,B)
y <- ifelse(y<1,y,0.99999999)
y <- ifelse(y>0,y,0.00000001)
MU=A/(A+B)
vardir=A*B/((A+B)^2*(A+B+1))
dataBeta = as.data.frame(cbind(y,x1,x2,x3,x4,vardir))
```

```

dataBetaNs=dataBeta

##Do not use parameter coef and var.coef
#saeHBbeta <- Beta(formula,data=dataBeta)

```

Binomial

Small Area Estimation using Hierarchical Bayesian under Binomial Distribution

Description

This function is implemented to variable of interest (y) that assumed to be a Binomial Distribution using Logit normal model. The data is an accumulation from the Bernoulli process which there are exactly two mutually exclusive outcomes of a case.

Usage

```

Binomial(
  formula,
  n.samp,
  iter.update = 3,
  iter.mcmc = 10000,
  coef,
  var.coef,

```

```

    thin = 2,
    burn.in = 2000,
    tau.u = 1,
    data
  )

```

Arguments

<code>formula</code>	Formula that describe the fitted model
<code>n.samp</code>	number of sample
<code>iter.update</code>	Number of updates with default 3
<code>iter.mcmc</code>	Number of total iterations per chain with default 10000
<code>coef</code>	a vector contains prior initial value of Coefficient of Regression Model for fixed effect with default vector of 0 with the length of the number of regression coefficients
<code>var.coef</code>	a vector contains prior initial value of variance of Coefficient of Regression Model with default vector of 1 with the length of the number of regression coefficients
<code>thin</code>	Thinning rate, must be a positive integer with default 2
<code>burn.in</code>	Number of iterations to discard at the beginning with default 2000
<code>tau.u</code>	Prior initial value of inverse of Variance of area random effect with default 1
<code>data</code>	The data frame

Value

This function returns a list of the following objects:

<code>Est</code>	A vector with the values of Small Area mean Estimates using Hierarchical bayesian method, if there is non sampled area, then the result of estimation of μ in nonsampled areas are the probabilities
<code>refVar</code>	Estimated random effect variances
<code>coefficient</code>	A dataframe with the estimated model coefficient
<code>plot</code>	Trace, Dencity, Autocorrelation Function Plot of MCMC samples

```

Description

This function is implemented to variable of interest (y) that assumed to be a Exponential Distribution. The range of data is $y > 0$)

Usage

```
Exponential(
  formula,
  iter.update = 3,
  iter.mcmc = 10000,
  coef,
  var.coef,
  thin = 2,
  burn.in = 2000,
  tau.u = 1,
  data
)
```

Arguments

formula	Formula that describe the fitted model
iter.update	Number of updates with default 3
iter.mcmc	Number of total iterations per chain with default 10000
coef	a vector contains prior initial value of Coefficient of Regression Model for fixed effect with default vector of 0 with the length of the number of regression coefficients
var.coef	a vector contains prior initial value of variance of Coefficient of Regression Model with default vector of 1 with the length of the number of regression coefficients
thin	Thinning rate, must be a positive integer with default 2
burn.in	Number of iterations to discard at the beginning with default 2000
tau.u	Prior initial value of inverse of Variance of area random effect with default 1
data	The data frame

Value

This function returns a list of the following objects:

Est	A vector with the values of Small Area mean Estimates using Hierarchical bayesian method
refVar	Estimated random effect variances
coefficient	A dataframe with the estimated model coefficient
plot	Trace, Dencity, Autocorrelation Function Plot of MCMC samples

Examples

```

ExponentialDouble	<i>Small Area Estimation using Hierarchical Bayesian under Double Exponential Distribution</i>
-------------------	--

Description

This function is implemented to variable of interest (y) that assumed to be a Double Exponential Distribution or Laplace Distribution. The range of data is $(-\infty < y < \infty)$

Usage

```
ExponentialDouble(
  formula,
  iter.update = 3,
  iter.mcmc = 10000,
  coef,
  var.coef,
  thin = 2,
  burn.in = 2000,
  tau.u = 1,
  data
)
```

Arguments

formula	Formula that describe the fitted model
iter.update	Number of updates with default 3
iter.mcmc	Number of total iterations per chain with default 10000
coef	a vector contains prior initial value of Coefficient of Regression Model for fixed effect with default vector of 0 with the length of the number of regression coefficients
var.coef	a vector contains prior initial value of variance of Coefficient of Regression Model with default vector of 1 with the length of the number of regression coefficients
thin	Thinning rate, must be a positive integer with default 2
burn.in	Number of iterations to discard at the beginning with default 2000
tau.u	Prior initial value of inverse of Variance of area random effect with default 1
data	The data frame

Value

This function returns a list of the following objects:

Est	A vector with the values of Small Area mean Estimates using Hierarchical bayesian method
-----	--

refVar	Estimated random effect variances
coefficient	A dataframe with the estimated model coefficient
plot	Trace, Dencity, Autocorrelation Function Plot of MCMC samples

Examples

```

NegativeBinomial	<i>Small Area Estimation using Hierarchical Bayesian under Negative Binomial Distribution</i>
------------------	---

Description

This function is implemented to variable of interest (y) that assumed to be a Negative Binomial Distribution. The data is a number of the Bernoulli process. The negative binomial is used to overcome an over dispersion from the discrete model.

Usage

```
NegativeBinomial(
  formula,
  iter.update = 3,
  iter.mcmc = 10000,
  coef,
  var.coef,
  thin = 2,
  burn.in = 2000,
  tau.u = 1,
  data
)
```

Arguments

formula	Formula that describe the fitted model
iter.update	Number of updates with default 3
iter.mcmc	Number of total iterations per chain with default 10000
coef	a vector contains prior initial value of Coefficient of Regression Model for fixed effect with default vector of 0 with the length of the number of regression coefficients
var.coef	a vector contains prior initial value of variance of Coefficient of Regression Model with default vector of 1 with the length of the number of regression coefficients
thin	Thinning rate, must be a positive integer with default 2
burn.in	Number of iterations to discard at the beginning with default 2000
tau.u	Prior initial value of inverse of Variance of area random effect with default 1
data	The data frame

Value

This function returns a list of the following objects:

Est	A vector with the values of Small Area mean Estimates using Hierarchical bayesian method
refVar	Estimated random effect variances
coefficient	A dataframe with the estimated model coefficient
plot	Trace, Dencity, Autocorrelation Function Plot of MCMC samples

Examples

```
##Data Generation
set.seed(123)

Normal	<i>Small Area Estimation using Hierarchical Bayesian under Normal Distribution</i>
--------	--

Description

This function is implemented to variable of interest (y) that assumed to be a Normal Distribution. The range of data is $(-\infty < y < \infty)$

Usage

```
Normal(
  formula,
  vardir,
  iter.update = 3,
  iter.mcmc = 10000,
  coef,
  var.coef,
  thin = 2,
  burn.in = 2000,
  tau.u = 1,
  data
)
```

Arguments

formula	Formula that describe the fitted model
vardir	Sampling variances of direct estimations
iter.update	Number of updates with default 3
iter.mcmc	Number of total iterations per chain with default 10000
coef	a vector contains prior initial value of Coefficient of Regression Model for fixed effect with default vector of 0 with the length of the number of regression coefficients
var.coef	a vector contains prior initial value of variance of Coefficient of Regression Model with default vector of 1 with the length of the number of regression coefficients
thin	Thinning rate, must be a positive integer with default 2
burn.in	Number of iterations to discard at the beginning with default 2000
tau.u	Prior initial value of inverse of Variance of area random effect with default 1
data	The data frame

Value

This function returns a list of the following objects:

Est	A vector with the values of Small Area mean Estimates using Hierarchical bayesian method
refVar	Estimated random effect variances
coefficient	A dataframe with the estimated model coefficient
plot	Trace, Dencity, Autocorrelation Function Plot of MCMC samples

Examples

```
#Data Generation
set.seed(123)
m=30
x1=runif(m,0,1)
x2=runif(m,1,5)
x3=runif(m,10,15)
x4=runif(m,10,20)
b0=b1=b2=b3=b4=0.5
u=rnorm(m,0,1)
vardir=1/rgamma(m,1,1)
Mu <- b0+b1*x1+b2*x2+b3*x3+b4*x4+u
y=rnorm(m,Mu,sqrt(vardir))
dataNormal=as.data.frame(cbind(y,x1,x2,x3,x4,vardir))

```

```
## For data with nonsampled area use dataNormalNs
```

Poisson	<i>Small Area Estimation using Hierarchical Bayesian under Poisson Distribution</i>
---------	---

Description

This function is implemented to variable of interest (y) that assumed to be a Poisson Distribution. The data is a count data, $y = 1, 2, 3, \dots$

Usage

```
Poisson(
  formula,
  iter.update = 3,
  iter.mcmc = 10000,
  coef,
  var.coef,
  thin = 2,
  burn.in = 2000,
  tau.u = 1,
  data
)
```

Arguments

formula	Formula that describe the fitted model
iter.update	Number of updates with default 3
iter.mcmc	Number of total iterations per chain with default 10000
coef	a vector contains prior initial value of Coefficient of Regression Model for fixed effect with default vector of 0 with the length of the number of regression coefficients
var.coef	a vector contains prior initial value of variance of Coefficient of Regression Model with default vector of 1 with the length of the number of regression coefficients
thin	Thinning rate, must be a positive integer with default 2
burn.in	Number of iterations to discard at the beginning with default 2000
tau.u	Prior initial value of inverse of Variance of area random effect with default 1
data	The data frame

Value

This function returns a list of the following objects:

Est	A vector with the values of Small Area mean Estimates using Hierarchical bayesian method
refVar	Estimated random effect variances
coefficient	A dataframe with the estimated model coefficient
plot	Trace, Dencity, Autocorrelation Function Plot of MCMC samples

```
## For data with nonsampled area use dataPoissonNs
```

PoissonGamma	<i>Small Area Estimation using Hierarchical Bayesian under Poisson Gamma Distribution</i>
--------------	---

Description

This function is implemented to variable of interest (y) that assumed to be a Poisson Distribution which its parameter (λ) is assumed to be a Gamma distribution. The data is a count data, $y = 1, 2, 3, \dots$

Usage

```
PoissonGamma(
  formula,
  iter.update = 3,
  iter.mcmc = 10000,
  coef,
  var.coef,
  thin = 2,
  burn.in = 2000,
  tau.u = 1,
  data
)
```

Arguments

formula	Formula that describe the fitted model
iter.update	Number of updates with default 3
iter.mcmc	Number of total iterations per chain with default 10000
coef	a vector contains prior initial value of Coefficient of Regression Model for fixed effect with default vector of 0 with the length of the number of regression coefficients

#plot(saeHPoissonGamma$plot[[3]]) is used to generate Density and trace plot

## Do not using parameter coef and var.coef
#saeHPoissonGamma <- PoissonGamma(formula,data=dataPoissonGamma)

## For data with nonsampled area use dataPoissonGammaNs
```

Description

Provides several functions for area level of small area estimation using hierarchical Bayesian (HB) method with several univariate distributions for variable of interest. The dataset that used in every function is generated accordingly in the Example. The 'rjags' package is employed to obtain parameter estimates. Model-based estimators involves the HB estimators which include the mean and the variation of mean. For the reference, see Rao and Molina (2015) <doi:10.1002/9781118735855>.

Author(s)

Maintainer: Zaza Yuda Perwira <221710086@stis.ac.id>

Functions

Beta Produces HB estimators, standard error, random effect variance, coefficient and plot under beta distribution

Binomial Produces HB estimators, standard error, random effect variance, coefficient and plot under binomial distribution

Exponential Produces HB estimators, standard error, random effect variance, coefficient and plot under exponential distribution

ExponentialDouble Produces HB estimators, standard error, random effect variance, coefficient and plot double exponential distribution

Gamma Produces HB estimators, standard error, random effect variance, coefficient and plot under Gamma distribution

Logistic Produces HB estimators, standard error, random effect variance, coefficient and plot under logistic distribution

Lognormal Produces HB estimators, standard error, random effect variance, coefficient and plot under lognormal distribution

NegativeBinomial Produces HB estimators, standard error, random effect variance, coefficient and plot under negative binomial distribution

Normal Produces HB estimators, standard error, random effect variance, coefficient and plot under normal distribution

Poisson Produces HB estimators, standard error, random effect variance, coefficient and plot under poisson distribution

PoissonGamma Produces HB estimators, standard error, random effect variance, coefficient and plot under poisson gamma distribution

Student_t Produces HB estimators, standard error, random effect variance, coefficient and plot under student-t distribution

Student_tnc Produces HB estimators, standard error, random effect variance, coefficient and plot under student-t (not central) distribution

Weibull Produces HB estimators, standard error, random effect variance, coefficient and plot under weibull distribution

Student_t	<i>Small Area Estimation using Hierarchical Bayesian under Student-t Distribution</i>
-----------	---

Description

This function is implemented to variable of interest (y) that assumed to be a Student-t Distribution. The range of data is $(-\infty < y < \infty)$

Usage

```
Student_t(
  formula,
  iter.update = 3,
  iter.mcmc = 10000,
  coef,
  var.coef,
  thin = 2,
  burn.in = 2000,
  tau.u = 1,
  data
)
```

Arguments

formula	Formula that describe the fitted model
iter.update	Number of updates with default 3
iter.mcmc	Number of total iterations per chain with default 10000
coef	a vector contains prior initial value of Coefficient of Regression Model for fixed effect with default vector of 0 with the length of the number of regression coefficients
var.coef	a vector contains prior initial value of variance of Coefficient of Regression Model with default vector of 1 with the length of the number of regression coefficients
thin	Thinning rate, must be a positive integer with default 2

burn.in	Number of iterations to discard at the beginning with default 2000
tau.u	Prior initial value of inverse of Variance of area random effect with default 1
data	The data frame

Value

This function returns a list of the following objects:

Est	A vector with the values of Small Area mean Estimates using Hierarchical bayesian method
refVar	Estimated random effect variances
coefficient	A dataframe with the estimated model coefficient
plot	Trace, Dencity, Autocorrelation Function Plot of MCMC samples
